I use findu for the source if I don't have an on board telemetry log file. I built a Query page for findu at:

http://findu.eoss.org

Go there and read about the various query forms. If a flight has occurred fairly recently you can get the actual data that was sent into APRS-IS. Query for the data, copy the data to a clipboard and stick it into a plain text file and save it and this data should be able to be parsed by Balloon Track. BT will handle most APRS formats including Mic-E and the NMEA strings as well. If the data itself does NOT have timestamps embedded, you can check a checkbox on the query form to include a timestamp for each string and BT will use that timestamp as the GPS Time stamp. However it is going to be a little off in time due to network transmission, dup checking etc. It is usually good to a few seconds and so is pretty useful.

If the flight you are looking for is older than a week or so you need to use the third query down for "older tabular position data for a specific station". This data goes back around 180 days. So if you are within 6 months of a flight and need the data it's there and available. This data doesn't parse inside of BT, but it is already in a form that is usually easy to deal with in a spreadsheet so you can derive most info with ease. If you are attempting to generate course and speed from packets then you'll have to calculated that from the lat/long/time elements. A handy reference for formulae that will deal with this type of stuff is at:

http://williams.best.vwh.net/avform.htm

I use his algorithms throughout BT. If you plan to do this a lot then you might want to use Excel and the Visual Basic for Applications capability to program a spreadsheet to do this for you. Enter in two pairs of lat/longs and you can get the spreadsheet to pump out range and bearing from one to the other, thus with the addition of the timestamp you can get course and speed.

That spreadsheet was perfect dude!

Now how did you take the raw data from like what was recorded on finu or aprs.fi and get it in there/

Check out the GPS engine evaluations on Ralph Wallio's web site:

http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm

EOSS has had great luck with the old Rockwell Jupiters with the newer firmware. They've reported up past 117K' for us, and are rated to 30km (130K').

As new rcvrs get validated, they oughta make it onto this list - good or bad.

EOSS's Rockwell Jupiter is rated to 40,000m vice 30,000m as I fumbled
earlier (30km = 131.2K', which is pretty challenging for latex).

Hi Joe,

The Min Diam & Max Diam windows are the balloon diameter limits for a fill.
Those are the default values, but you can change either to whatever is needed
to get the desired ascent rate or burst altitude - just click in the window
and key in your desired values.

Hi Rodney,

Getting a balloon up to 135K' will be a lot tougher task than getting a
GPS that will report that high. The ambient pressure up there is about
2 mbar, so the balloon volume will be about 5x greater than that at 100K'.

If you encounter PBC, the GPS patch antenna may lose a decent view of
the sky, or lose & regain sigs from a given sat at a rapid spin rate.
That can confuse the li'l micro-brain in the GPS engine.

Steve made available a short 11 minute video of our last launch of NSS-48.
Enjoy, and thanks Steve, nice job, and good editing if you know what I
mean he he he..

The wind i thought was a lot faster than the editing mentions.

It seems like we all will be seriously starting to make a national organization for ARHAB activities. Similar to the Tripoli and NAR groups that the high power rocketry people have. This I think is a good idea especially with the sudden influx of all the news media lately ballooning has had.

I think a nicely set up on the groups once it is made web page should be a nice basic how to and what not to do page.

I still see the EOSS gang still have the basic page up at
http://www.eoss.org/pubs/faqloon.htm
Man does that bring back memories! it's clearly out dated, but also a lot is still good strong advise.

And their page that tries to explain the legal talk of FAR Part 101 and how it effects our flights at,
http://eoss.org/pubs/far_annotated.htm
Is a major good start.

I propose while we are talking about the formation of the national organization or group, how about all you out there that have been doing this for a long time join me in really making part 101 soo clear and understandable that anyone even with absolutely no knowledge of anything aviation regulation wise is it in perfect clear easy to understand language. with examples of payloads that would meet a typical rule and a payload the does not meet the rules. make it incredibly simple.

who is with me on doing this task as a group effort?

If so I made a yahoo group for us to do this in as a group. it's at.

http://groups.yahoo.com/group/FarPart101/

Anyone?

Hi Joe,

Nice thing about exempt flights is you can ignore cloud cover and visibility constraints.

BTW, didn't see any special precautions using H2 inside that garage - even ran the garage door opener and did some flash pix!

Thats what i was thinking,

Use the yahoo group as a think tank of all those interested to hash out
the thouhts and meanings for final publications on the official sites.
because the arhab.org would be a perfect place to store all this great
info for new comers to go and get the real info. yaknow?

Some chipsets that don't have the altitude limit may have a 78,000 limit (I believe that's what I was told once).....the Inventek units with the balloon mod have a 137,000 feet limit....depends on how they do the Kalman filtering.

Hi All,

Ok we all know about that 60K alt limit many GPS's have (we found another today) But when that limit is lifted, is there another limit? window? if so what altitude is it at?

Subject: [GPSL] Lift Win

I love all these gadgets we get to play with now that we diddn't have 20+ years ago. While this program of Bills and Hank's revisions is almost as old as ballooning itself,, I have never used it till i tried it last night.

seems pretty cool except for one thing,, that I wonder about

What are the Min diameter and max diameter windows.

Ok onto another when i plug in the spec's for yesterdays flight, it jives right on with everything that happened.

isn't it cool when things match the real world?

BUT

when i plug in what we would have flown if the winds were Ok would have been a 2000 gram balloon using H2 for gas, a 1.25 pound payload, and a extra pound of free lift, (2.25 pounds lift on the balloon neck with no payload)

Punch in those numbers and the program wont show me reasonable lift amounts,

what do i need to do to be able to see say 1 pound of free lift?

I tried re sizing the window like any regular "Windows" you do and a grab and drag doesn't work.

Joe

Hi Rodney,

I've flown the Inventek balloon mod module about 18 times in the past 2 years....works great when you use a Sarantel Helical antenna with it....I should have the boards available with the chip and antenna near the end of the month. I tested it out about 3 weeks ago on a UAH flight with a Microtrak300 and it powered right up and started to report it's location within a minute. It was a lot faster position lock than using a Garmin 18.

Hi Joe

The fellow Garmin who did the presentation for us at GPSL 2009 mentioned that their code has an arbitrary limit built in based on the routines they use to calculate their positions. In consumer grade units, to make calculations faster to perform they use approximations based on a GPS being used near the ground so they become inaccurate at very high altitudes. If I recall correctly their formulas start to become inaccurate when you're 2 or 3 thousand feet up so their consumer code is designed to stop working before that happens. I suspect other manufacturers do similar things.

Ok, now I'm confused where does this 16 bit thing come into play and why?

Reason saying is we have had the Garmen hocky puck exceed that altitude 32,767 meters (107503 feet) several times, well in to the teens Like 112,000 and 118,000 feet. This is frustrating he he he,,

Hi Joe,

I think you'll find that few have direct experience with how well GPS units function at that altitude. As far as I know, there aren't any that have known limitations at 125,000 ft that aren't already present at lower altitudes above 60,000 ft. The only possibility I can think of is software limitations that might prevent calculation or reporting of altitudes above 32,767 meters (that's the maximum value of a 16-bit signed integer).

Cloud cover and visual constraints aren't an issue for exempt flights? I
did not know that but it is good to know.

That "government-ese" in the FARs is too much. I much prefer plain English.

I hate the use of the term, "exempt flights". It makes it sound like we
want exemptions from FAR 101. I often have to explain to the flight service
office that we are flying under the requirements of FAR 101 and that we are
not asking for an exemption.

tHAT IS WHY I JUST FORMED THAT YAHOO GROUP FOR THE EXPERIENCED BALLOON GROUPS TO WORK ON MAKING A TOTALLY UNDERSTANDABLE IN PLAIN ENGLISH VERSION crap caplock sorry gang, anyway, i'd liove to make a set of plans a eventual web page that goes through that document line by line in their words and then as a group of the experienced groups explain in english what it actually means, with examples of payloads that meet or do not meet the rule being covered. it would be a great beginner resource.

7013. Re: [Balloonatics] Balloon Organization.

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-11 03:06:50 UTC
From: Mike Manes
Topic: 7013 Message: 7013

Hi Scott,

Well, you did note the major benefits of a national ARHAB organization, and they're not minor issues for some of us.

Liability insurance: EOSS submitted RFQs for liability coverage for its operations back in the salad days, and Lloyd's of London was the only underwriter to response - with a quote for absurd premiums. I note that one of our members has coverage under his homeowner's policy, but clubs like EOSS don't get such coverage. Even the ARRL policy won't cover balloon ops.

Dealing with regulatory agencies: And by this I mean the FAA. Now, EOSS has developed a pretty sound working relationship with Denver Center and NW Region, but some of their demands, such as having all flights back on the deck by 0930 local time, are unnecessarily intrusive. And comments posted to the FAA folks in DC seem to be totally ignored; my comments on the UAS NPRM, observing that the proposed rules don't mention FAR-101, and further, can be read to conflict with allowances under that long-established regulation. However, comments submitted by the national R/C model aircraft were not only acknowledged but also specifically addressed in the next round on that NPRM. So how far do you think that you, I or any other ARHAB ham might get with a proposal to update FAR-101, even to clarify the text, to define "impact strength", eliminate obsolete provisions like trailing wire antennas over 50 ft long and radar reflectors? Try getting something like I-gated APRS beacons in to replace phoned-in position reports every 2 hours!

Given that ARHABs been operating for over 20 years now without ANY national organization, I'm skeptical that the act of creating one would automatically induce the rise of a competing one. Now, I don't question your fear that the leadership of this national organization could get real pushy - however, application of tried and proven democratic principles with some means of balancing powers to the organization's charter could go a long way towards averting something like the ARES vs. RACES tempests that crop up locally here and there (guessing that's your ref point).

That's my $0.02, and it's about all I can afford to spend on it at this point.

Hi Pete,

Yeah, 14 CFR 101.1 is a tough read. But the bottom line is that if
your payload string conforms to the exempt limits (< 6# per box, <12#
total, 50# "impact strength" line, etc), then the ONLY rule that applies
is the "Catch 22" 101.7 "Hazardous operations". 101.33, which includes
the cloud cover and vis limits, only applies to non-exempt flights.

BTW, if you get crosswise with your FAA folks, they can pull a 101.7
job on you. It's happened. So behave!

There's a "readable" version of the balloon-related bits in FAR-101,
with how I've interpreted them, on the EOSS web site:

www.eoss.org/pubs/far_annotated.htm

It's been my experience that many of the FAA folks have as much
trouble reading that grammatical hell hole as we do! It helps to
replace "exempt" with a specific reference to 14 CFR 101.1(a)(4)
and a statement that you fully conform to that regulation.

There is a distributor in TX that gladly sells the Sarantel antennas in small quantities. I purchased a couple last year for the B-LAN master module project. I don't recall the name off the top of my head but I will grab it when I get back to the office tomorrow evening.

Hey Bill,

Did you have any luck getting small quantities of the Saratel quad helix GPS antenna? We're down to our last MicroPulse VIZ flex circuit quad, and when I last checked Sarantel, they weren't interested in non-OEM qty orders.

Hi Mike,

I get mine from Jim D. Gray and Associates....they aren't cheap however...about $25 each....used to be $16 each just a few months ago....but they sure do work well.

Sarantel 1010021 Geohelix-S Active GPS Antenna 24dB

http://www.jdgastore.com/index.php?act=viewProd&productId=15

There's a couple of versions both active and passive...but this is the one that I've flight tested many times.

From: L. Paul Verhage
Topic: 7013 Message: 7020

We're coming up on the 25th anniversary of the first modern day near space launch. I'd like to see us commenorate the event with an ARHAB year, modelled after IGY. I tried to do something like this several years ago and it didn't take off, but I'd like to try again. Create Space is a publish on demand website. We could create a book of all the launches and stories of 2012 as a way to celebrate the year.

I talked to the AMA last year about insurance. Let me try to bring up this conversation again and involve the people I talked with last year.

I agree with Mike that an ARHAB organization shouldn't be pushy or regulating (we already have enough regulation with the FAA and FCC). But one voice would be great.

7021. GPSL Schedule

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-11 17:33:00 UTC
From: Zack Clobes
Topic: 451 Message: 7021

So I'm hearing a lot of "national organization" chatter again... Do we need to schedule some formal time to discuss this at GPSL?

Topic: 451 Message: 7022

Zach,

I'd suggest that we have the conversation right after lunch on Friday. I won't need (or take) 30 minutes. You could move my talk to the end, after Brian's talk on UI-View.

Howard

I have purchased a number of antennas and other GPS accessories from these guys over the last few years . They delivered as promised and the couple of time I spoke to them were helpful and knowledgeable. I have no other association with them other that being a past and infrequent customer.

There is a distributor in TX that gladly sells the Sarantel antennas in small quantities. I purchased a couple last year for the B-LAN master module project. I don't recall the name off the top of my head but I will grab it when I get back to the office tomorrow evening.

Hey Bill,

Did you have any luck getting small quantities of the Saratel quad helix
GPS antenna? We're down to our last MicroPulse VIZ flex circuit quad, and
when I last checked Sarantel, they weren't interested in non-OEM qty orders.

I've had good luck with Jim D. Gray too.

For the record, I tried one of their cheaper "Quadrifiler V GPS Antenna, +3V 14db", part number QV1 with the Inventek GPS, and I couldn't get a lock from it. It's possible that I had a solder bridge or something, but I unsoldered that one, and put the Sarantel in its place, and it's been working perfectly ever since.

Yes, I know it's down in performance, but you would think that in a clear view of the sky, it wouldn't make *that *much difference. For what it's worth, the guy at Jim Gray's through that it would work...

One other thing about that antenna, when I put it on my dash in the Jeep next to my Garmin Nuvi, the Nuvi would immediately lose its satellite lock when the Inventek would fire up. It's almost like the Inventek/antenna/amp were going into some sort of oscillation.

All of those problems went away with the Sarantel.

7027. GPSL Participation Survey

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-11 19:06:24 UTC
From: Zack Clobes
Topic: 7027 Message: 7027

I'm getting close to the point of needing finalized numbers for food, chairs, etc. Please take a few minutes to fill out the Participation survey so that I can give intelligent numbers to people who ask.. :-)

I would greatly appreciate it if you would nominate one spokesperson from each group to compile your answers so I won't have to guess who's affiliated with whom. If at all possible, please have this filled out by June 13th. If you are not 100% sure at this point, please give me your best estimate, and maybe a note in the Comments section that it may be changing.

Interested,

Another thought is,,, that i haven't pushed deep into is forming a corporation for your persnal ballon group. like a LLC or similar to provide the liability buffer between the group and it's members? i haven't dug deep into any of these ideas LLC's of incorporation like a 5013c etc.. i have enough tax headaches as it is at the moment to create another entity to keep track of. anyone have any backgrounds on the levels of member ship liability protections from these method?
> I agree with Mike that an ARHAB organization shouldn't be pushy or
> regulating (we already have enough regulation with the FAA and FCC).
> But one voice would be great.
And I agree here also. Not pushy But the one voice as Mike stated with his level of being ignored when talking to the FAA.

Mike knows about it, and the FAA is rally the way they are. Like you know if you had a payload that is coming down, and it might land someplace not really safe,, Like a busy downtown large city, a nuke plant,, or a major airport Like Chicago Ohare international. The payload is falling towards one of these examples.

You know they have absolute no care if it is or not if you met all the guidelines of far part 101, but then of course that magic clause, that they can get you on on any flight at all.

But the FAA will not allow you to remedy the situation. It's coming down towards Ohare! and it's gonna land there. but thats fine,,, wow huh. But say you see it's going to land there and you have the capability to steer the payload away from Ohare so it lands in a safe place. THIS IS ABSOLUTELY FORBIDDEN!!!!

If you are able to steer it the FAA calls it a UAV now and if you fly a UAV that is not flight certified with all the same certs a 747 must pass. Imagine the trouble they could get you in.

They see absolute no difference between a several ton Predator UAV and a under 1 pound UAV.. BOTH in the rules are UAV's and are not allowed in the NAS PERIOD!

That's whats crazy! even a balloon that flys under the Exempt cause area. if it flies as normal. fine, of you can control where it goes it now a free balloon under exempt laws now it is now a UAV!! i fought with them for 2 years on this one. But I'm only one guy.

We had better luck getting permission to launch both a super loki ballistic missile and a large rocket with a "P" size motor from a balloon launch platform right here in wisconsin was far easier getting permission that it is getting a steerable exempt payload permission. crazy.

7030. Re: [GPSL] Re: [Balloonatics] Balloon Organization.

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-11 19:56:37 UTC
From: Zack Clobes
Topic: 7013 Message: 7030

I've been having discussions again with my State Farm agent, and basically he told me that if it was MY balloon that "lived" at MY house, then the home owners liability would extend to the balloon.

I've already taken a slightly different route and put my balloons under my home-based LLC business. Now my home owners coverage has become more of a gray area, and he recommended that I purchase a general liability coverage for my LLC, which runs a little under $300 per year.

As far as just creating an LLC to fly balloons under, my opinion is that by itself would be a foolish thing to do. If your balloon falls and cracks a windshield, then it doesn't really matter if the LLC cracked it or you did, someone is still going to have to pay to replace that glass.

7032. Re: [GPSL] Sarantel GPS quad helix antennas

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-11 21:26:49 UTC
From: Mike Manes
Topic: 6974 Message: 7032

Thanks, Bill,

So I guess the trick is to find a Satantel distributor willing to work
with us onesie small fry (another argument for a natioal organization, BTW).

The Rockwell Jupiters have fair to middlin' front ends, so we've never
needed an external preamp - just a decent passive quad helix with a few
inches of coax feedline. Since there are no active devices in the antenna,
it can be located with a clear view of the sky without thermal concerns.

I'll pop over there and see what I can drum up.

Yeah, I think there's enough interest to hold a conversation. Suggest putting it early in the agenda so it doesn't get bumped off the end like it did a few years ago.

7034. Re: [GPSL] Sarantel GPS quad helix antennas

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-11 21:42:23 UTC
From: Mike Manes
Topic: 6974 Message: 7034

Hi Zack,

We've encountered a coule of instances where two GPSs in close proximity QRMed each other. It's not at the 1.5 GHz RF freq, but at the 10 MHz IF, where signal levels are much higher. One incident happened between the autopilot GPS on a CU glider and our APRS beacon package - both within a foot of one another in the fuselage.

The other was when one of the tracker's handheld GPS was placed on the AE0SS-11 APRS beacon at the landing site before it was powered down - both readings were way off from one another, and both were wrong.

A word to the wise when flying redundant APRS beacons - keep 'em well separated on the payload string (at least 5 ft).

From: Mike Manes
Topic: 7013 Message: 7035

Some states, e.g. Colorado, have regulations that protect non-profit volunteer organizations and their principals from a degree of liability. But it's a state-by-state situation. So it might be worth a visit to your state's secy of state web site so see what protection may already be in place.

But, of course, nothing prevents a tort suit from being filed against you and your club, and lacking insurance coverage, you're stuck with the attorney's fees to defend against it - fingers crossed the court could rule the suit frivolous and order reimbursement of those fees. But it's still a major cash flow problem in real time.

In the meantime, it's a good idea to document all the steps you've taken to mitigate the risk to the public for every flight, since that'll form the basis for a sound legal defense. Conformance to FAR-101 is a good start, but not nearly enough.

I'd like to see the issue of a national organization be brought up again at GPSL. I'm looking for my email contacts about the AMA and possible insurance. Last year I invited them to attend GPSL and see what we do. My take was that we build and fly model satellites. AMA builds and flies model airplanes. There's some similarity, but perhaps not enough to interest AMA.

If a national ARHAB group were to form, they would have to collect some sort of dues for everyone's insurance. What kind of structure does the ARRL have? Would we be something like that?

Or perhaps we should model ourselves after AMSAT. We're close to satellites.

ARHAB-NA.

7038. Electronics interfering with GPS

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-12 00:45:57 UTC
From: lpcoates
Topic: 7038 Message: 7038

Hi

The Sarantel thread got me thinking about this. We often see electronics in payload interfere with the gps in the same playload. Most recently it was a "chewing gum" "spy" video camera. The camera is just about perfect for a balloon but it completely stopped the GPS from working when it was within a foot or two of the antenna. I've heard of and experienced ATV transmitters on 439.25 causing problems with GPSs. Has anyone else had success in finding and mitigating interference from nearby electronics? In particular, what frequencies have people found to be common causes. What did you do to eliminate or reduce the problem. What about different antenna types, patch, quadrifilar, amplified, passive, etc.

Thanks

Bruce, VE5BNC

7040. Entertainment for spouses question

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-12 00:56:21 UTC
From: Zack Clobes
Topic: 7040 Message: 7040

There's a new(er) cooking store in Hutch that offers cooking classes to small groups. It was suggested that they could have a class for some of the wives on Friday afternoon.

I'm not sure how they price it, but most of the classes seem to be in the $20-$35 range. If this is something that would interest those who are not attending the symposium, I'd be happy to try to coordinate this.

I'm not positive, but I think we'd have to guaranty at least 5-8 participants.

Here is a link to the store and some of their classes that they're currently offering, to give you an idea what's available.

http://www.apronstringsstore.com/special_events.php

If anyone would be interested in this, please let me know ASAP so I can try to coordinate something.

This is not related to flight interference, but related to my T&R mobile installation. I have an old trusty upgraded 12 chan. Garmin GPS 20/20 TracPak GPS that I have used for 10 years. It has never failed me until I installed a new Farenheit brand 3x4 video display radio with bluetooth, SD card reader & iPod capable. The 20/20 normally sits on the center of the dash of my Jeep Cherokee against the windshield right over the radio. Since installing the new radio I had to move the 20/20 at least 6" to the left or right or it just would not get a lock. I might try to lay a flat piece of metal under the GPS and see if it will help.

I've had digital cameras affect my GPS-18 - seems to desense it by 20 dB or so, and made it lose lock on one flight. My "mitigation" was to go back to the GPS-35 power hog (~130 mA at 5V), which doesn't seem to be affected. Maybe when you eat that many electrons, stray RF doesn't bother you. :)

The Concord 4060 was the one that gave me trouble. I now use a Canon A560
but have not tested it against the GPS-18 for desense (it rides on the
GPS-35 payload).

Hi Zack

Unfortunately that's my biggest obstacle. My camera module uses the GPS signal to coordinate turning things on and off. Yes, I could just use a simple timer to do it, but where's the fun in that? ;-)

Hi Bruce,

I assume you're talking about this particular "chewing gum" sized camcorder distributed by Hobbypartz and also MCM Electronics. I've flown it several times on our last few flights....taped to the outside of my payload with absolutely no insulation besides the duct tape. It actually did a pretty decent job. Considering it was exposed to the elements it still worked up to about 28,000 feet and took some nice video (although not as high resolution of a Flip Ultra but it is half the price and 1/10 the weight)...it is amazingly lightweight (18 grams) and the sound it recorded was good. I got some nice video from it. I plan to power it from the external USB port instead of relying on it's small internal battery, add some insulation and it should work for 2 hours or more I would think.

http://www.hobbypartz.com/smvicarewfr2.html

I did notice it does produce EMI noise so I kept it some distance below the GPS antenna.

All,

We have had some success removing RFI by placing the camera in an enclosure covered with tin foil and grounding it.

You can test this with GPS devices that give signal readouts.

Hi Bill

It actually the ones being flogged on eBay for well under $20. I'm not sure if they're identical or just a knock-off. They look the same as the one from hobbypartz. I'm also using an "MD80" model that's much the same with different packaging. The last one took 90 minutes of video before the battery was exhausted. With mine, applying USB power puts it into mass storage mode where it can't record video, but it does recharge the battery and also generates enough heat to keep things from freezing.

We've run into problems with GPS receivers jamming each
other. On one flight, trying to run a Garmin eTrex and a
Motorola Oncore, if the units were within 6" of each other,
the eTrex wouldn't get a position fix.

In a terrestrial
application (NTP timeservers), I've had a Garmin GPS-18 LVC
and a Deluo serial GPS fight when mounted on the same steel plate,
again less than 6" apart. One receiver got fixes, but frequently
lost them, the other never got a fix. I moved them apart by
6 feet and now both run flawlessly.

7053. Re: [GPSL] Electronics interfering with GPS

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-13 01:15:13 UTC
From: Mike Manes
Topic: 7038 Message: 7053

Hi Bruce,

EOSS used to encounter problems getting decent 3D lock with our early Magellan GPS engine when it was co-located in the same payload enclosure as our 70 cm AM ATV xmtr. This was completely resolved by exporting the ATV to a separate payload located at least 3m down the payload string from the GPS/APRS payload.

However, this also prevented us from adding a GPS-based data overlay on the ATV video until Steve K0SCC developed our "Balloon-LAN" (B-LAN) ZigBee link from a separate GPS payload to a ZigBee receiver in the ATV package. That scheme has worked nicely.

We've also encountered some RFI problems with early-generations of the TinyTrack APRS beacon generators - we tracked this down to xmit RF getting into the low-level signal traces on the TT PWB causing very distorted packet audio, and even TT processor upsets. This was corrected by replacing the 1/4 wave 2m antenna mounted on the package with a flexible J-pole fed with about 1m of coax hanging below the payload.

Subject: [GPSL] Electronics interfering with GPS

Hi

The Sarantel thread got me thinking about this. We often see electronics in payload interfere with the gps in the same playload. Most recently it was a "chewing gum" "spy" video camera. The camera is just about perfect for a balloon but it completely stopped the GPS from working when it was within a foot or two of the antenna. I've heard of and experienced ATV transmitters on 439.25 causing problems with GPSs. Has anyone else had success in finding and mitigating interference from nearby electronics? In particular, what frequencies have people found to be common causes. What did you do to eliminate or reduce the problem. What about different antenna types, patch, quadrifilar, amplified, passive, etc.

Thanks

Bruce, VE5BNC

One beauty of the EOSS B-LAN model is that we can fly one payload that houses a GPS and B-LAN transmitter (ZigBee) and that we can configure the system to "broadcast" the NMEA-0183 sentences such that as many modules and necessary on the flight string can receive the GPS info for the price (paid in size, power and compatibility) of an integrated ZigBee enabled device.

We also have a ground based B-LAN flight line module that is used to monitor B-LAN (and in this case GPS) operation prior to launch to make sure that all is good and GPS is locked prior to launch. Somewhat by accident using this we learned that the Maxstream ZigBee modules (one high power and one low power both with integral wire stub antenna) will communicate approximately 15Kft evenly with poor antenna geometry.

As an aside our B-LAN wireless data buss can also be configured to operate in a polling master model to allow other data to traverse the flight string between modules as needed. Still a lot of work to be done here to further enhance this and build/publish a simple interface toolkit for our "customers" to integrate against. A future phase of the system design is also envisioned to extend high speed air to ground data as well (not ZigBee based) but that area has not materialized in the real world yet. When we do that my intention is to use LabView as the ground station environment to allow us to easily configure monitoring and logging on a per flight/experiment basis.

7059. Possible streaming video of the BalloonSat forum at the Dayton Hamvention today

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-14 14:39:23 UTC
From: wb8elk@aol.com
Topic: 7059 Message: 7059

Depending on cell coverage inside the arena....there will be two streams possibly sending out the BalloonSat Forum at 12:15 pm to 2:15 pm today EDT (Friday May 14).

www.batc.tv

Click on "Members Streams"

Then try the stream called " KE6BXT" and hit "watch stream"

also "WB9KMO" will try as well under that same list.

7060. Balloon flight Saturday May 15th at 11am from Dayton Hamvention

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-14 15:21:02 UTC
From: wb8elk@aol.com
Topic: 7060 Message: 7060

Balloon will be launched from the Dayton Hamvention at 11:00 am EDT Saturday May 15th.

APRS on 144.39: WB8ELK-10
APRS on 144.34: N0OY-11

DominoEX on 146.565: N9QGS (it's either EX16 or EX22, can't remember which speed I set Ron's up for).

- Bill WB8ELK

Streaming video possible of the launch: www.batc.tv click on Members Streams...then select either KE6BXT or WB9KMO.

There are some locals going out to look, they say where it landed it.s
only a few feet deep. so even if all of it went to the bottom,, if it's
less than 20 feet or so, Linda had a bunch of like cause ribbons
attached to a LONG LONG string. 100'+ so they might be floating even if
all the payload stuff is not.
Flight 49,, and might be out first to not recover. Bummer!

Hi Joe...my WB8ELK-10 APRS tracker today at the Hamvention was a "bubble-wrap" special as well....6 AA lithium batteries, Microtrak300 with SMA-24 whip and my new Inventek GPS board. It weighed in at 8 ounces....all mounted on a 2 inch wide strip of foamcore and surrounded by 3 layers of clear small-cell bubblewrap. The last few flights I've used this system it got a GPS lock in less than a minute at powerup.

Hi Joe....the bubblewrap payload should float....we splashed down in the Tennessee River a couple weeks ago and a bass fisherman found it within minutes of landing...my APRS payload was still working after they fished it out of the water.

Yours will wash up on shore or be found by a fisherman in short order.

Well, parachute nylon is lighter than water, so unless it got pulled
down, then the landing site ought to be easy to find. GL bringing
any soaked payloads back to life. If there's no electrolytic corrosion,
then chances are good if you wash 'em out in clear water, like take 'em into
the shower with ya :=). It's worked for me.

7071. Dayton Hamvention balloon has been recovered

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-15 18:39:29 UTC
From: wb8elk@aol.com
Topic: 7071 Message: 7071
Attachments: 1 described; binary payloads are missing from this source WARC

The Hamvention balloon landed southwest of Darbyville, Ohio in an open field about 300 feet from the road and managed to miss the high tension lines about 500 feet to the south....Ron N9QGS could see the parachute from the road. However, the white payload with the Flip Ultra Camcorder and the FindMeSpot unit was not attached and likely the string holding it broke at burst. So far I haven't seen any updates from the FindMeSpot unit but am hoping it will come on soon....It was very lightweight so hopefully it didn't hit too hard....however if it hit hard, it may not be functional so will have to rely on the Reward sign.

Photo of the landing spot attached.

Joe, did I miss posting one of your flights?

Not really,

It was a last minute crunch to test another GPS. it arived late
yesterday so we diddn't even know if we were going to have anything to
test fly.

so diddn't advertise it at all.

Joe and all,

Interesting you should ask about the three online prediction programs....I wish I had thought to compare these when the 15z data was still active so I could compare it against my actual flight path....but I will tell you that the Near Space Ventures Online Balloon Track was very accurate for today's flight, particularly in the parachute descent portion....the burst was a few miles further west of my prediction probably due to a small difference in the overall ascent rate...or possibly the Reynolds number knee effect (which by the way can be modeled in the PC version of Balloon Track).

Online Balloon Track on the Nearspace Ventures website will give you the identical results of the PC version of Balloon Track since they use the same algorithms.

The Univ of Wyoming predictor doesn't allow you to change the ascent or descent rates so unless you happen to match those same parameters in your flight, it will be not be usable for accurate predictions. As you can see from the attached map, it shows a landing site 10 miles further downrange than online balloon track and the CUSF predictor from the UK....70 miles instead of 60 miles. The actual track and parachute modeling seems good but unless they provide us with an option to adjust the ascent and descent rates, it's not usable. The MIT students recommend this in their balloon guide to the general public so I imagine folks just starting out will be losing some payloads.

The Cambridge University (CUSF) online predictor is nicely done, but you'll have to convert to the metric system....the hardest part is to make sure you use meters/sec instead of feet/minute. Other than that, it also is quite accurate....the burst points are very close between the CUSF site and online Balloon Track....however, their parachute modeling puts the descent portion further downrange. Since the parachute descent was quite accurate on online Balloon Track's prediction today compared to my actual flight, I would that they may be modeling the parachute with a different coefficient of drag than is used in online Balloon Track....whether they are predicting a bit too long or not on the descent portion is something I'll have to compare during upcoming flights. Other than that, it's a very nicely done display and map.

Attached are the three screenshots for today at 1800 UTC's wind model....1400 ft/min up 1000 ft/min dwn 69800 feet max. 39.82 -84.26

Ours was really weird Bill,

We flew the exact same payload as last week. Just a bigger balloon.
What made no sense was tho the acent rate and path matched ventures
perfectly like withinn a mile real to predicted. but the flight down
while the final decent rate matched the numbers from last flight, and
this one post flight too. but the path of the decent wasn' even close
at all to the predicted one. and the balloon landed at least 20 miles
downrange also.

very strange.

Good luck getting support from these clowns. I bought 2 GPS units from them last year, one arrived DOA. I contacted them both by email 2X and voice mail 1X and not ever a call or email back. They don't get my vote, and I am pretty easy on suppliers typically.

I think part of the descent problem is due to the fact that we should be picking up a downline sounding as well. The initial ascent prediction is based on the airport you supply. But the 100 miles later descent is based on the same one. Where it most likely should be base on a new one. This is actually something Troy has talked about a number of times doing automatically. And in fact if you look at the projection, all airports within the flight path are actually displayed partially in preparation for this coding effort.

Who wants to tackle the perl code for Troy and make this happen?

7079. Re: [GPSL] Prediction Programs

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-16 15:08:47 UTC
From: HarryM
Topic: 7074 Message: 7079

This is something that I have done for almost all flights especially when OSU flies. I will use the Stillwater sounding to the west, Tulsa to the east and compare the two flight paths. I will also use other soundings in the area depending on the initial prediction. Sometimes I have used up to 4 seperate soundings for comparisons. This does give a more accurate landing prediction.

Topic: 7074 Message: 7080

Hi Bill and everyone.

A continuation of the below topic of flight prediction programs, sites, etc.

Any programmers out there? Now I faintly remember something about what I am about to describe from at LEAST a decade ago. And at least for me it never came to be. Or if it did I missed it, not an unusual event, especially since our group took off several large gaps in activity. But if it did not happen, anyone up to trying to make it, or if it did happen, where is it so I can use it? With the awfully skilled people we have now making prediction web sites and prediction programs, maybe it's time we did what I am going to try to describe below.

I was thinking just now, and I of course don't know anything about programming so what I'm about to say may sound simple, but in reality is impossible to implement. Maybe? I dunno.

Ok we have a flight scheduled. And we plug into say like the NSV site all the details, location, rates of climb, fall, burst altitude etc. (by the way guys,, can we ask for an addition like baltrak has a float option? Where we can specify a float altitude and duration? That would be super cool!

Ok we go to run a prediction. and we get the data from the national weather service. For the direction and speed of the winds aloft. We plug it all in, you all know what I'm talking about. And we tell it to tell us the flight profile! Super cool!

But these data sets from the NWS can be easily 14 hours old even! Then we also guess the estimated rate of climb and fall. and tell this all to that programs and it spits out the predicted landing location.

But there we go for the reason of the errors from prediction to real world is the variables. The estimated speed up and down as well as how fast the NWS data can be changing. Especially if a front is passing through etc. but it's what we have, is what we have and it does work amazingly well.

Now this is where I may not know what I'm talking about, but then again maybe it's really simple too and just no ones tried to do it? A new system...

Lets see we run a prediction, exactly the same as before described above, and make our best guesses and get the best winds aloft data possible. and make a prediction, and it spits out using Google maps the flight profile as usual.

Now the program remains in like a standby mode? or something,

Now How does APRS.FI or Findu grab the dats from how ever it gets it's info from the balloons, to plot the balloons position. Can we not now also grab this dats stream and have it each time a new packet bundle comes through have it use this ultra freash sounding data info the get an exact true sounding now. Ya know what i mean?

why can we not use the very same data hello? what does the weather service supply? the flight of their balloon, by the speed and diretion it's moving it tells us what the winds aloft are.

after we lift off why can we not harvest this same dats and have it automatically with every packet bundle of data re calculate the new landing position with this perfect and highly accurate movement of the balloon?

we have true speed and directions as well as rate of climbs and falls not guess estimates.

have the program using this brand new data constantly tweak the estimated landing spot?

So it's like a blend of the NSV prediction site and APRS.fi sites. we see the predicted flight path, and the balloons current prediction, and as the flight is progressing along the site uses this fresh sounding data coming directly from the balloon, (can't get sounding info any fresher than this) and it for each bundle re calculates the final resting landing spot.

Is this possible,

Yes?
No?

Hey all,
While perhaps not directly useful for the APRS system, the latest version of http://spacenear.us/tracker has an integrated flight predictor which uses the latest GFS data and then in realtime updates its landing prediction, its really helpful when chasing the flight especially for the last 500m or so when you lose the radio signal.

Currently it uses the atmospheric model that is used in the CUSF predictor but an additional algorithm has been written that calculates the actual ballistic co-efficient based on the descent data to make it even more accurate - just waiting for it to be integrated.

I've also seen PIC code that does landing prediction onboard the flight computer itself which uses the ascent profile to calculate its landing site which it downlinks over the radio - this is very useful in the UK as we can use it to automate the cutdown to avoid landing in the sea.

Regarding calculating balloon float I've got some hacked scripts that combined the CUSF ascent predictor with the NOAA Hysplit modelling program to generate long duration flights.

It certainly wouldn't be a challenge to lift the data off aprs.fi and then continually run it through a predictor to generate a realtime landing site preditction.

Joe,

If I understand correctly, you are suggesting to use the data collected during the ascent to help predict the flight path during the descent. If that is the case, the MapPoint add-in I wrote does just that. The real-time flight path prediction combines the flight data with the NWS data (from READY) to plot a predicted flight path.

I'm intrigued with the suggestions to use more than one sounding to improve the accuracy of the flight path prediction and will begin to investigate how I might add that to my add-in. Presently, I am testing a recent change in the add-in to use the measured ascent rate for the real-time flight path prediction.

Information about the add-in is here:
http://www.surfingsatellites.org/flighttrackhelp/fthelpcontent.htm

The download page is here:
http://www.surfingsatellites.org/surfingsatellites.aspx?Page=FlightTrack.Download

From: Ed Moore
Topic: 7074 Message: 7083

Hi Joe,

The CUSF predictor does include a 'float' option - a time in seconds spent at a particular altitude. cuspaceflight.co.uk/predict

Your main question is an interesting one. The question is really if knowing the winds at your current altitude (based on live telemetry) helps you better estimate the winds at higher altitudes for the rest of the flight. This correlation we seek is infact very complex and non-linear, and is the sort of thing the forecast supercomputers concern themselves with, but it is significantly beyond the scope of our prediction program. A naive approach of saying 'the winds seem to be 10% faster than predicted so let's add 10% to all the predicted winds' doesn't work at all, and when we tested it 'just to see' produced significantly worse results than trusted the a priori GFS data.

To answer Bill's question about our descent calculation, it just assumes eqilibrium the whole way down, using the standard drag equation. I think eqilibrium is a fair assumption as the the erros induced by the initial post-burst downwards acceleration are negligible.

As James Coxon mentioned, I wrote a quick algorithm for the online tracker (spacenear.us/tracker) which should calculate the actual ballistics of the falling payload to improve the landing prediction in real time. It should hopefully be integrated soon.

Another tool is cuspaceflight.co.uk/hourly-predictions . This provides the locus of landing points for launces on the hour for the next 5 days, for a given ascent/descent profile. This gives a useful 'week at a glance' to see what the atmosphere has in store for us.

Well not really, I'm i guess thinking of having it do what we do
manually during a flight. we have the predicted route. and we see what
it's doing real time. and we see that it's running say 5 miles to the
southeast as to compared to the prediction. so we in our minds move the
predicted landing spot more to the south east.

or the winds at 10K feet were 90 deg and 38 MPh, but we see in reality
that they are now via the balloon 110 deg and 62 MPh, and the program
adjusts the prediction accordingly.

I think Rick's WinBallTrak does include feature that extracts a new wind
table from the real-time ascent data and uses it after burst to forecast
a new descent trajectory and landing site. Rick typically runs this several
times during descent and beacons out the new landing predict in APRS via
the balloon's digi.

Was your problem with Sarantel or SparkFun?

FWIW, I've made 3 orders with SparkFun, and never had a problem - so
my experience is positive. But then, I've not had a problem to
resolve with them, either.

Nice video of the Dayton Hamvention balloon launch as well as a good report on the Hamvention as well. This was filmed by WHIO Channel 7 TV of Dayton, Ohio.

I have had zero problems with Sarantel. My problem was with 1 DOA Copernicus GPS. I bought 3 total over time, 2 worked fine, one was flaky. Sparkfun did not return emails or calls. I know some people like these guys, I was one of those. But no longer.

I don't doubt your experience, but I'd have to say it was at least somewhat isolated. I've purchased 2-3 orders from them. I called in one time to see if I could add something, and was greeted with a real person who was nice and responsive, even though she couldn't do anything for me (the order had already left their door).

7092. Re: Prediction Programs

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-17 13:18:16 UTC
From: jjdemeyer
Topic: 7074 Message: 7092

I was thinking about this a little more. Presently, we use a single sounding to generate and evaluate predicted flight paths. Multiple soundings may be used (different geographic areas or different times) but the result provides confidence in a predicted path or landing site.

Could the present methods of prediction move to simplifying this work and review multiple sounding data? I see three methods for providing this.

The first method collects sounding data from different geographic regions. Here in Ohio, I might use Detroit and Pittsburg for an east-west flight. The prediction algorithm uses Detroit data for ascent and Pittsburg data for descent. The algorithm could be smart enough to monitor the flight duration and pick some point to switch between soundings.

The second method collects sounding data from different times near the target launch time, e.g., 12z and 15z. The prediction algorithm uses the 12z data for the ascent and the 15z data for the descent (again, flight duration could be a factor in choosing what data to use).

The last method also collects sounding data from different times near the target launch time. The algorithm provides a predicted flight path for each sounding. This method deomonstrates how the direction of the flight changes over a three hour period.

To answer my original question, prediction methods can be simplified to algorithms. In my experience, algorithms like this require time and data to validate. The data also is used to improve the algorithm over time.

Over the Summer, I hope to implement and evaluate some of these methods in the MapPoint add-in I spoke of earlier.

Other thoughts from the community?

Joe

First thing is there is no actual 15Z sounding data. The NWS only launches at 0000Z and 1200Z. So a 1500Z data set is some sort of "Fudging" made to try to warp the data. But that isn't as bad as what it's really warping. Data that is at least 12 to 14 hours or more old.

Say you planned on flying at 1500Z today. It's 1400Z now and you grab the freshest data possible. thinking this is fresh and accurate. well sadly no it's still data from yesterdays evenings sounding flight from 0000Z

This mornings flight just barely happened.1200Z launch. and all that. I have been keeping track of how long it takes for these soundings to propagate through the system. And it's been for the last month or so it has been taking between 5 to 6 hours for the data to up date.

You can see it happen. You grap numbers run a prediction and it changes like a mile or so. you keep doing this and it keeps changing but ever so slowly, the rubbering of data.

Then suddenly a BIG change happens where the predicted landing spot now jumps like 15 miles! Ok, new dataset just came through.

For me here in CDT land this happens usually between midnight and 1 AM, and in the mornings between Noon and 1 PM. So when you run numbers in the morning pre launch it is still numbers from the flight the evening before. and a LOT can happen in 12+ hours.

Thats why i was wondering why we are not using our very own sounding balloon data we are flying. can't get data anymore fresh that the beacon interval rate!

From: jjdemeyer
Topic: 7074 Message: 7094

Thanks for catching that! I agree that 15z has been 'processed' through the NWS models.

We have seen a delay in data as well. We typically wait for the noon data to generate a new flight path prediction so we have new sounding information. We have found that flight path predictions don't stablize (or become more consistant, maybe) until the week of a launch.

I see two questions in this thread. First, can we use the data from our flight to predict the flight path? Second, can we make a better prediction before the launch?

I saw Mike reply to the first questions and I think I've seen it work in BalloonTrack; I have implemented in my MapPoint add-in. In my add-in, it can update the predicted path with every new packet. In my tests, I have the predicted path updated every fifth packet. The answer to the first question is yes.

The second question may be just me reading more into the thread but I do find the prediction of the flight path interesting and want to explore possibilities to help make the prediction accurate. I agree that time and 'processing' will affect the outcome, and the predicted landing site would be a best guess at the general area of touchdown. When I'm planning a flight, a best guess might help determine accessibility to the landing site, provide the opportunity to determine alternative launch sites, and methods of deploying recovery teams. I'm sure there are more things to consider.

Joe

From: HarryM
Topic: 7074 Message: 7095

Food for Thought

The method I use is to average all the predictions for the day prior to and the morning of, flight. Using UOW prediction data for several airports I will draw 5mi circles on the map in the LZ area. This works pretty good IF there are no weather systems crossing the area. If there is, the predictions will swing wildly as expected. The accuracy of predictions also depends on where you are in relation to the NWS launch sites. Here in Tulsa I am in a void of coverage for at least 100 mi. in all directions. If I launch prior to 1000hrs I find that the flight favors the 1500hr data prediction.

On one flight a few years ago, we got that morning's RAOB data from a site less than 50 miles S of the predicted straight ESE forecast trajectory. Image our surprise when the balloon took off and headed straight SW for about 25 miles before executing a hard left at 30K' to finish up the rest of the ascent heading due E.

My point is that forecasts that use models are no more than best guesses, and even using nearby wind data just a few hours old isn't much better, especially if there's instability in the area. Further, the winds can (and will) change over the duration of a flight.

So it's probably a good idea to give any forecast landing a generous CEP (circular area probable), and even more margin if the isobars are real "twisty". And do expect that Murphy will work to put you down in the least desirable spot in your CEP. Folks who have made the record books for accuracy of landing vs. forecast prolly shoulda bought a lottery ticket that day!

7098. Canon Powershot A560 Camera

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-23 00:29:24 UTC
From: Joe
Topic: 7098 Message: 7098
Attachments: 1 described; binary payloads are missing from this source WARC

Ok, who out there know much about these cameras?

We flew one with the CHDK script a while ago. just taking pictures..
LOTS of pictures 16 GIG's of pictures and it worked perfectly.

Today we flew this camera in video mode. Because it is the one and only
camera that I have found so fat that can simultaneously record on the SD
card AND send live composite video out to the ATV transmitter for down
linking. AWESOME!!!!

I tested the camera many ways before flight.

Like this was with a 2 GIG card. Diddn't want to wait for over 2 hours
to see what happens when the memory card gets full. But with a 2 gig
card this only takes 17 minutes.

OK,

Test #1- What happens when card gets full while recording?

Nothing, it gets to the end, a message appears, and says memory card is
full. And stops recording, but the composite output keeps outputting.
And the video is fine and saved on the SD Card.
Very Good.

Test #2- What happens if the batteries die while recording?

Same thing. it gets to the point where the battery low indicator has
been flashing for a long time. and then stops recording. And the camera
shuts down. But the video file is fine and saved ok. But the camera does
shut down. so the composite video stops.

So this looks great for our flight.

But this is what happened during the flight..

Launch happened and everything is fine. 40 minutes into the flight. I
see the message (busy) this it does when it's saving the last of a file
and closing it. And after the busy went waay, it stopped recording but
was still acting as a camera for the ATV transmitter. so Ok, Not great
but still good images from thr ATV tranny.

Then about two minutes later the signal go to black. Transmitter is
still transmitting.. but it's transmitting a solid perfect black
picture. not one sparkie or nothing! GRRRR! This would be some
awesome clear video. oh well.

Flight finishes and payload is recovered, and upon opening it is noticed
that the camera is still runing. hmmmm? it has not shut down.
It was a 16 gig card and it only has used 4 gigs of it.

sooo anyone have any idea as to what happened? anyone willing to take a
guess?

a you tube vid of the first part of the fflight can be seen at

From: L. Paul Verhage
Topic: 7099 Message: 7099

Any t-shirt ideas? I came up with this.

My balloon went to near space and all I got was this t-shirt.

7103. RoboMolloon1 failure

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-24 03:21:07 UTC
From: ccccrnr@aim.com
Topic: 7103 Message: 7103

if anyone was listening for KI4NHK-11 with comment RoboMolloon1 yesterday May 22, thanks

our 1st launch didn't get off the ground
filling the balloon it drug on the parking lot pavement where we were filling and launching which I think created a weakness or tare not noticed until we had dumped the entire 240ft^3 of Helium into the balloon
The tare found was about 1 to 1.5 inches after deflating
Also the balloon didn't have much if any positive lift for carrying the payload upward. We were hoping to get 1,000-1,400ft/min of climb. So we are wondering if the helium we got didn't contain the purity we were expecting (however with it all gone there isn't a way to test) so we'll be going though our calculation to make sure that the whole 5 ft cylinder should have provided plenty of lift (as expected) for out payload+radar reflector+parachute+balloon

Our electronics we prepared has APRS telemetry and a cross band repeater, and a video camera pointed down.
With this ready we thought we may try our relaunch at GPSL 2010, as there would be lots of experience to help us do better.

What does our group need to do to be able to come and launch at GPSL 2010??

Thanks,
Carlton

Carlton,
Sorry that your first attempt was unsuccessful. Several of us have had similar experiences along the way. Personally, I had one balloon that we had to jettison after filling when a stabilizing hand accidentally poked a hole in the latex. A second balloon (a Kaysam with a little age) tore off the cardboard neck spreader just before the planned release. A third balloon, which we planned to float, separated from the float valve at launch. Failures are part of the game.
As for GPSL, all you have to do is come to Hutchinson. The talks, both formal and informal, on Friday are very good. There will be plenty of us there that can help you with the launch. I've never met a friendly group of folks. When our team showed up at Grand Island in 2007, and didn't even use the 2-meter band or have a ham license, Roger KC0MWM and everyone else welcomed us and provided lots of assistance. I hope you can come.
By the way, Did you use LiftWin to calculate your helium fill? 240 cu. ft. of helium should lift 8 pounds of payload with an ascent rate of almost 1100 ft/min. The tear may have been venting more helium that you realized.
Hope to see you in Kansas. By the way, we'll be rolling through St. Louis on Thursday, the 22nd sometime in mid to late morning. I always take the MO 370 shortcut through the bottoms and over the Missouri River. If you want to make it a convoy, please let me know.
Best wishes,Howard, KC9QBN

Yes, you are welcome to come down for GPSL in July. I would ask that you please fill out the Participation Survey and the Flight Information survey on the superlaunch.org website.

That helps me plan for food, chairs, etc...

7108. Re: Hydrogen vs. Helium

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-24 17:36:57 UTC
From: BASE
Topic: 7103 Message: 7108
Attachments: 1 described; binary payloads are missing from this source WARC

I know this sort of information has been posted before, but I want to share it, especially for the newer members on the list.
Helium is not that much different from hydrogen as a lifting agent. This is because the lift force comes from the difference in the weight of the different gases. Hydrogen is a diatomic gas, and helium is monatomic.
Using the following values for densities (which I copied from http://www.elmhurst.edu/~chm/vchembook/imagespdb/123Adensitygas.html#table) :
Hydrogen gas 0.000089 grams/cubic centimeter 0.0056 pounds/cu. ftHelium gas 0.00018 grams/cubic centimeter 0.0112 pounds/cu. ftAir 0.00128 grams/cubic centimeter 0.0799 pounds/cu. ft
240 cu. ft of Hydrogen would weigh 1.34 pounds, 240 cu. ft of helium would weigh 2.67 pounds and, 240 cu. ft of air would weigh 19.2 pounds. The lift force is equal to the weight difference:
for Hydrogen 17.9 pounds (essentially as Joe says)for Helium 16.5 pounds
Now we have to lift the balloon, parachute and payloads. In our BASE flights, we have often approached the 12 pound limit for our flight string which if we fly it on a 1200 gram balloon yields a free lift of 2.27 pounds for hydrogen (ascent rate of 700 ft/min) and 1.02 pounds for helium (ascent rate of 500 ft/minute).
Burst altitude would be the same since the same volume of gas is put into the balloons. According to LiftWin the burst would be at 91 kft.
Of course, there are two related advantages to hydrogen. It is much less expensive and essentially in infinite supply since hydrogen can be readily extracted from a variety natural sources.
Howard

I'd still like to pay you folks a visit. I tried visiting St. Louis in
March, but the weather didn't cooperate. Perhaps we can work out something
before GPSL and run through the steps I use to launch a balloon.

We're receiving door prizes from Parallax (www.parallax.com). Can we add them to the Super Launch webpage as a sponsor? Please add Nuts and Volts magazine also, they are giving us magazines for our welcome packets.

Zack, does the city of Hutch have a vistors bureau? Perhaps they could give us discount tickets or such.

I have to head out now but if you don't find any, there are a bunch of them (photos of LOTS of small payloads) at the eoss site. I'll check back when I return home later tonight and see if you had any luck and if not send some links.

Date: 2010-05-28 12:12:56 UTC
From: Michael Willett
Topic: 7124 Message: 7124

Below is an email I received via our web page regarding help with an AHAB launch in the LA area.

Recently, I tracked a GPS test launch in that area that went near Catalina island and then near downtown LA, but do not recall the group's name or contact information.

Please contact Debbie, noted below and copied on this email about help with a possible June 7th launch for a TV spot.

--Michael K5NOT

Hi Debbie!

I do know there have been some balloons launched in the LA area. No
doubt north as well.

Where are you located?

I can put a note on the balloon groups page and see if anyone pops up
near you.

I'm actually in Los Angeles. We are needing someone with experience and expertise in launching a near space balloon. We are doing a television show segment on the topic and need an expert to bounce some ideas off of.

We are looking at a June 7th launch date.

Any help would be greatly appreciated.

They reach me at my email:
Dmtyner@...

Thank you!

Debbie Tyner

Thanks, Hank,
Those sure don't look like any latex or PE balloon I've worked with.
They appear to be coated fabric - perhaps like those used for advertising?
Heavy but reusable. Guess he must have vent valves to dump gas for descent.

Mike,

I especially think you and the other pilots will like digging
through Jonathan's cluster balloon website:

http://www.clusterballoon.com/index.asp

The whole website is just awesome. Beautifully done and
really chock full of content, both in words and in pictures.

This is just one account I've been able to go through
(beside the channel one which really is unfinished):

Spirit Cluster nightime North Carolina flight

http://www.clusterballoon.com/SpiritCluster.asp

Can you imagine spending an entire night hanging from
nylon straps? Notice the references to hams and APRS.

Wouldn't it just be amazing to have Jonathan attend GPSL
2010?

Hank

7129. cluster balloon English Channel- details

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-29 14:10:35 UTC
From: Mark Caviezel
Topic: 7129 Message: 7129

Indeed, most of Trappe's balloons are extensible 'chloroprene' which looks, feels, and handles exactly like latex. Some other balloons are PVC, still extensible, but not as much. The PVC balloons can handle the expansion from surface to 7 or 10k feet MSL. The chloroprene balloons are good to over 60k feet.
One architecture that he has used in the past is one K bottle per choroprene balloon. Those balloons are about 630 grams, very similar to latex balloons. That yields about 12 pounds net lift per cell.
Vent valves have been experimented with, but (very predictably, Jonathan had to figure this out on his own) far too ineffective for effective flight control. His normal flight controls are vernier water ballasting and cell cut away. A normal 12 lb net lift big cell is a large chunk of lift to loose, sometimes he adds some smaller cells, too.

I've conducted flight performance analysis on a couple of his flights- twelve pounds of free lift (positive or negative) yields about 200 fpm climb or sink.

His initial departure at the Blueberry festival flight was less than 50 fpm, accelerating appreciably throughout the morning because of solar heating of the cells.

Trappe has shown that the cluster balloon vehicle is indeed a controllable aircraft. I know the rest of his year is booked but he is slated to appear and fly at the EAA event in Oshkosh, WI this summer.

Hi Mark,

Well, manned gas ballooning has been around for about a century, but Trappe's twist on it is to use multiple, cheap bags in lieu of just one biggie. I suspect that the multi-bag configuration may suffer from a lower bag weight to gas lift ratio, however. But it DOES look a LOT kewler than a single bag.

I'm quite interested in knowing the sources of both of these
variety of balloons. Is at least one of these types you've
mentioned the type used in advertising?

Do you have any cost figures for the sizes Jonathan is using?

> I know the rest of his year is booked but he is slated to appear
> and fly at the EAA event in Oshkosh, WI this summer.

Well, that will make him a pretty well known figure among at least
the experimental aircraft community in the US. Should also lead
to some more national video and print coverage of his exploits.

Surely I would think it appropriate to let him know about
GPSL 2010 and specifically invite him to it, along with any
of his gear. If he's not available this year, try to get
him next year.

It's surprising he hasn't mentioned more here by us
balloonatics, especially with the amateur radio connection.
Incidentally, I've now read the small 3 day flurry of Trappe
messages on this list from February of this year.

Well, manned gas ballooning has been around for about a century,
>>>> Mike, sometimes I am not sure where you get your information from. Manned gas ballooning had been around for about a century by 1883, as the first manned gas balloon flight was conducted on December 1, 1783. Interestingly, this was less than two weeks after the first hot air balloon flight in November 1783. We are well into the third century of manned ballooning. Although hot air was the first technology for manned flight, gas ballooning was the dominant technology until the 1960's.

I
suspect that the multi-bag configuration may suffer from a lower bag weight
to gas lift ratio, however. But it DOES look a LOT kewler than a single bag.
>>> Your suspicion, although not unreasonable, is unfounded. For the chloroprene cells, 14.43 lbs gross lift in a 1.4 lb cell yield 90.4% net lift to gross lift. A conventional 1000 cubic meter gas balloon envelope weighs about 450 pounds, achieving a net lift to gross lift ratio of 83%. And that's at sea level. The conventional gas balloon will continuously vent as it ascends, eroding the ratio. So, Trappe's system is actually pretty high performance compared to other technologies.

I'm pretty sure Trappe gets his chloroprene balloons from
http://www.balloonsdirect.com/weather-balloons.htm
and his PVC or vinyl balloons were custom made by Tracy Barnes.
The PVC balloons are relatively expensive (reportedly about $1k each) but feature incredibly low permeability and are re-usable. The chloroprene balloons are usually single use.

Cluster ballooning is no-where close to new. Don Piccard's father conducted a cluster flight in 1937, Don himself has done multiple flights as early as 1958 and as recently as 2003.

best

Mark,

I was referring to the US Army's rather common use of H2 balloons during WWI, not the sporadic experiments prior to then.

My analysis was based on simple geometry, comparing the surface area of single vs. multiple spheres having the same total volume, assuming equal skin densities and configurations.

From: Mark Caviezel
Topic: 7136 Message: 7136

I was referring to the US Army's rather common use of H2 balloons during
WWI, not the sporadic experiments prior to then.

>>>> Let's not forget that an organized, annual international competition for sport ballooning started in 1906 (and it was not the first). In his book, 'My Airships', aviation pioneer Alberto Santos Dumont describes a rather mature ballooning industry in Paris in the 1890's, with multiple pilots offering rides and flight lessons to those able to pay for them. Many aeronauts of the 1700's and 1800's made hundreds of flights. A number of pilots made a real career of flying balloons between 1783 and the beginning of WW1. Given these documented, historical facts, I'm not sure that it is accurate to describe this very significant amount of aeronautical knowledge as merely 'sporadic experiments.'

My analysis was based on simple geometry, comparing the surface area of
single vs. multiple spheres having the same total volume, assuming equal
skin densities and configurations.
>>>>> Ah, understood. But in exactly the same way that
the skin thickness on a B757 is far greater than a Cessna 152, you'll find that a conventional gas balloon has a far greater areal density than a 630 gram chloroprene cluster balloon cell.

7137. NSS-50 Flight Summary Video.

Yahoo group: GPSL (2009 — 2010)
Date: 2010-05-31 21:42:57 UTC
From: Joe
Topic: 7103 Message: 7137

Afternoon All,

Well, NSS-50 is in the Bag.

It was pretty interesting, we still again learned some new stuff. Even after 50 flights still keep learning new stuff.

One thing we learned this flight is the upper winds are weird! Sometimes!

We flew our usual stable flight train for a Video flight. long flight train and stabilization arms.

All performed as usual. at low altitudes. but once it got like above 80K it was really strange. The payload was like making a large cone circle. sometimes as large as like 45 degrees! Then other times is was a side to side swing also to these extremes.

While this was interesting, what i found interesting was the amount of time it would stay at the extremes! like if the whole flight train is tilted to a 45 deg angle, and how long it stayed that way weird.

enjoy!

Hi Joe,

Hey, nice video! Great to work with the Scouts, eh? And kewl beans
getting the local TV coverage! The last one of ours that hit the toob
was our disastrous first plastic balloon launch - high winds, and we hung
onto the payload until the balloon was downwind - payload slid across the
parking lot and smacked into a snow bank, jamming the camera film advance
motor, which drained our main payload and primary beacon batteries. Long
recovery, just trying to get close enough to the 10m beacon to hear it.

Re the long flight string: I think at best it slows down the period
of the sway, just like a long pendulum on a clock does. But it could
also create more sway than a short line going thru layers of wind shear,
since the balloon and payload will be seeing larger differences in wind
speed. Those inertial arms do a FB job of slowing down the spin, however,
especially on a payload that's aerodynamically symmetrical in the horizontal
plane (no weathervane effects).

How'd the descent video look?

Decent was similar. not as nice as the School flight. but still ok.

Too bad the GPS and Chute is still up in the tree. gotta go back and
see if the owner will allow a cut down. i'ts a nothing tree out in the
middle of a swamp anyway. so it's not like a tree in someones yard.

yup and thats one of the reasons we usually do ther long like is to make
the slow swing if it does at all.
>> But it could
>> also create more sway than a short line going thru layers of wind shear,

Really think in 100 feet there would be that much difference?

That would be a cool experiment if like have wind vanes and anemometers
say every 25 feet for 200 feet span and see how much fifference in air
movements athere actually is.
>> Those inertial arms do a FB job of slowing down the spin,

Yea we tried in the very beginning a weathervane system and it was worse
than nothing at all. it grabbed the gusts of wind and jerked it around
all the time, and when it wasn't gusty if he vane wasn't exactly
vertical it acted like a wing and itself spun the payload around because
of the 10 MPh wind flowing across it vertically!

Yeah, wind shear gradients can be pretty steep. Remember seeing that
video of one of the flights where the camera took a shot of itself
falling into the still-inflated balloon? Now THAT was severe shear!

Joe

On the announcements page (http://www.arhab.org/ARHABlaunchannouncements.html) I show your last flight as NS-48 did I get that wrong? Should that have been NS-50? All of the flight records are kept for posterity and I want to correct if it's wrong.

Congrats on a successful flight!

No you were right, We just didn't announce the last two flights.

NSS-49 was testing another GPS. So no big Deal, and NSS-50, yeah we
should have done something press wise. Just never got around to it, sorry<

7144. Notification Proposal

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-01 15:14:25 UTC
From: Keith Kaiser
Topic: 7144 Message: 7144

Fellow Aeronauts,

It has been proposed to me that when I add a posting to the ARHAB announcement page an automatic eMail be sent to the GPSL eMail list. This would mean not having to double post the announcement by whoever is setting it up and it would make sure we receive detail information about a flight in advance of the launch.

This proposal came out of a talk with Joe regarding his NOT pre-posting his NSS-50 flight which has subsequently generated quite a bit of traffic on the site. Joe says he'd "like that" so I'm asking the rest of you to chime in with your thoughts too.

Send notes to the list, unless you want to address me directly, then send it to wa0tjt@...

Thanks guys... 73's

Same here, But i guess that's why someone formed it as to have it be
the place to send out announcements without clogging up other lists.

Like GPSL was started i would assume to be for the GPSL, but it has
eveolved into a list for everyting. which is ok with me it doesn't matter.

I just know i myself miss flights because i do forget to go some page
and look it up.

SigIf you turn on "Automatic Notification" or "Daily Digest" you won't miss flight info or forget to check a list. I subscribe to most of the lists and keep up by using the "Automatic" email and this works great for keeping up with multiple lists.

I wonder how they are dispersed?

Maybe the paper flyers should be placed INSIDE the balloon and when it
pops then they are spread to a wide area!

Thats how i have all my lists set up (all 290 of them) all are set up as individual e mails and send them to me immediately.

but this even still will miss flights because i don't remember to go to the sked web page.

Seems best to stuff the gear inside the balloon. When it bursts, it
all comes down.

Ummm, perhaps we should test this by dropping propaganda over Kansas at
GPSL. We could pass the truth about the ourtside world to the unfortunate
residents of Kansas.

OK, but you guys are missing the point. Right now when a groups sends me a flight notification to post at http://www.arhab.org/ARHABlaunchannouncements.html I post the information to the web page but no one is notified I did so.

These notifications are sent to me at ARHAB Flights <arhabflights@gmail.com> which is NOT a distributed list.

The question is, do you want the web page postings to be sent to the GPSL (largest ARHAB related list) automatically or not?

I'd like it via e mail somehow.

kind of like how Ralph was doing it was great to me.

like 90%+ flights are on the weekends. a e mail like on tuesday or wednesday showing the up coming flights, say 2 weeks worth.

then on friday an up dated one would come out. this to me would be the ultimate.

From: Mark Conner
Topic: 7144 Message: 7157

I think we should put it to the Balloon_Sked list. The fact that the GPSL list has evolved beyond GPSL-related traffic (which is a pain) should not drive this bus. We now no longer have a list for just GPSL-related traffic.

I've been thinking we should reorganize or repurpose some of the lists. I'd like to see a national-level (or possibly international) A(R)HAB mailing list and revert GPSL to its original purpose. The KNSP list was originally for Paul's Kansas Near Space Project, then became a group for KS/NE/MO balloon groups. Now most groups have individual lists and I'm tempted to spin off a NSTAR list.

If there's consensus, I could research a name and set up a national/international list.

Yes the lists are already out there. GPSL should be only GPSL stuff,
have balloon sked for skeds, and blooning the generic catch all. yes?

Keith,

You use it and about 300 other folks, making it the largest
balloon list that I know of, certainly much larger than GPSL
(about 50% larger).

In fact your last post was March 30, one of three messages you
posted to Balloon_Sked in March 2010.

As an email subscriber to Balloon_Sked you should have received
the latest post on May 26 (Pete Lilja and NYT).

Hank
Balloon_Sked assistant moderator

Waited for my post to show up so I could correct it.

Actually Balloning is the largest at 435 (ANSR, Arizona).

Send them to Balloon_Sked. I would like to continue the discussion on
having a high-level A(R)HAB list and repurposing the GPSL list though.

I'm guessing "Ballooning" has a lot of subscribers due to its name -
probably pops up early on anyone doing searches.

The page as you see it is not as simple as it once was. Before I took it over Ralph maintained the page via a Word document. Today it is a true web page with lots of functionality that Ralph did not offer. It is true HTML with CSS to control its looks and Javascript/AJAX to automate a lot of it.

I want to do more but my perl sucks and nothing else is currently available (PHP for example) so at the movement whatever I do must be doable via Javascript, unless I have a volunteer who knows perl.

Joe,

You are subscribed to Balloon_Sked as receiving (immediate)
email notices. They range typically from 20 to 40 a month.

You already know that the last message was late May, so that
should be enough to answer your own question about whether
you're "getting" messages.

Only you know if you're reading the messages or even noticing
that you've received them in your email loaded with what must
be thousands of other emails a month you're getting from all
those lists.

Hi guys,

I've been getting emailed announcements for every change posted to the ARHAB announcement page for over a year now, using changedetection.com

http://www.changedetection.com/faq.html

Now, I get the same email with a link to the URL for that page even if the change is relatively minor, like a freq or launch site change, but there's also a link to a was/now version of the update, so you can tell if it's something interesting or not. If there's nothing coming up that I'm real interested in, I usually just del the announcement emails. So what would be neat would be if the ARHAB announcement page were set up such that it just listed upcoming scheduled or recently completed flights, with links to the nitty-gritty for those who are interested - that would just generate changedetection.com emails only when a new flight was posted or completed.

Just my $0.02.

I typically will send out launch announcements to the following lists: Balloon_Sked and Balloonatics (usually where balloon folks in the southeast hang out)...if it's a major event (particularly if using an HF telemetry transmitter that has the potential to be heard across the country or if I'm streaming video of the launch) I'll also include Ballooning and GPSL.

For an automatic email, I'd vote to send it to Balloon_Sked only.

7181. aprs packet settings

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-02 03:10:50 UTC
From: ccccrnr@aim.com
Topic: 7181 Message: 7181

What settings should be used for aprs trackers?
such as WIDE?-? for balloon and car so that both can show up on the internet
should this be in Comment or Status or where?

or are there other things that have to be set to be recorded on the internet?

I've been trying findu and aprs.fi and can't see myself or payload(on ground)
we want the internet gateways to record the packet positions, but also want to keep traffic to a minimum.

currently struggling with OpenTracker+, some guys in our group are AVR freaks and talk about getting WhereAVR

Sincerely,
Carlton
-.- .. ....- -. .... -.-

ps. I know another tech question..... too bad the ut wiki can't answer this :)

7182. Re: [GPSL] aprs packet settings

I think we have all had this question when we first get started in APRS and especially when starting AHAB tracking!

Your question can be answered several ways:

Most vehicles driving around in metro areas can use nothing in the PATH field and they can hit digi's. But generically, most of us will run WIDE2-1,WIDE1-1 to assure we get repeated overall.

In the middle of nowhere, where digis are far and few between, vehicles can use higher settings such as WIDE2-2, and higher, but this is rarely needed.

On AHABs, you can leave the PATH field blank if you are in an area that have several digi's that you can hit at altitude. Realize the footprint up there (say 85Kft) is around 300 miles in diameter, so many digi's can pick the AHAB up. NEVER use WIDE2-2 at high altitude because the digi's will flood the APRS network and you will be amazed at the traffic generated! It quickly creates a backlog at such low data rates.

On AHABs, at lower altitudes, use of WIDE2-1, WIDE1-1 works well. In the OT+ you can set a bank switch to happen at a certain altitude. Say at 15Kft, you might switch from bank0 to bank1, and bank0 might have WIDE2-1,WIDE1-1, and in Bank1 you might have PATH as blank.

I am sure there will be other opinions on this topic, but I feel the settings really depend on where you are flying the AHAB, how many digis you can see at low altitude and high altitude and you mileage may vary depending on those factors.

7183. Re: [GPSL] aprs packet settings

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-02 14:44:21 UTC
From: Mark Conner
Topic: 7181 Message: 7183

You don't want WIDE1-1 as the second call in any path, airborne or ground. Otherwise, when the packet is digipeated by the WIDE2-N station, every WIDE1-1 home station will then retransmit it. That's not a desired function. WIDE1-1 should be first in the path if it's ever used.

If you can path-switch on the balloon payload, use no path above a few thousand feet and WIDE2-1 or WIDE1-1,WIDE2-1 when low. If you can't path-switch, use no path or WIDE2-1 only.

See http://www.aprs.org/fix14439.html for a fuller discussion of the use of WIDEn-N.

I agree with Mike's statements....I like the balloon-techie discussions that occur here on the GPSL reflector...limiting discussions just to the yearly GPSL conference would make for some quiet times on the GPSL list most of the year. Quite a few of our members on this list are here because of the technical discussions and advice from some of the most experienced balloonatics you'll likely find anywhere and it may be disruptive to create yet another list just for these types of discussions. I know that keeping up with the several balloon lists that currently exist keep me quite busy.

I typically will send out launch announcements to the following lists:
Balloon_Sked and Balloonatics (usually where balloon folks in the
southeast hang out)...if it's a major event (particularly if using an HF
telemetry transmitter that has the potential to be heard across the
country or if I'm streaming video of the launch) I'll also include
Ballooning and GPSL.

For an automatic email, I'd vote to send it to Balloon_Sked only.

Joe,

You are subscribed to Balloon_Sked as receiving (immediate)
email notices. They range typically from 20 to 40 a month.

You already know that the last message was late May, so that
should be enough to answer your own question about whether
you're "getting" messages.

Only you know if you're reading the messages or even noticing
that you've received them in your email loaded with what must
be thousands of other emails a month you're getting from all
those lists.

Hi Carlton,

I currently use just WIDE2-1 for my APRS path with excellent results. If you aren't near a digipeater, then you won't see yourself on the Internet while on the ground when running low power unless you either drive near a local gateway station or digipeater or use your car radio as a digipeater relay. Gary Dion N4TXI in our group here in Huntsville designed the WhereAVR APRS module that uses the Atmel AVR series which I've flown many times, so if you have any questions on it, just let me or Gary know.

- Bill WB8ELK

Also....if you have a cellular modem attached to your laptop in the chase vehicle, you can gateway the packets your receive to the Internet using any of the popular APRS programs such as UI-View, APRS-SA, etc. When our chase vehicles are positioned near the predicted landing zone, then the world can see the final landing spot via a mobile gateway.

Subject: [GPSL] aprs packet settings

What settings should be used for aprs trackers?
such as WIDE?-? for balloon and car so that both can show up on the internet
should this be in Comment or Status or where?

or are there other things that have to be set to be recorded on the internet?

I've been trying findu and aprs.fi and can't see myself or payload(on ground)
we want the internet gateways to record the packet positions, but also want to keep traffic to a minimum.

currently struggling with OpenTracker+, some guys in our group are AVR freaks and talk about getting WhereAVR

Sincerely,
Carlton

I have a Powershot A560 in use with a CHDK script. I started with the basic intervalometer script and made a few mods to it to do things like inhibit the flash and a few other settings.

Hi Mark and everyone else here.

I was at the CHDK site and on the forum there and they say if you can do it with taking pictures, you can also do it when shooting video. But obviously a standard interlover for pictures does not work when the camera is in video mode. Here is as the story goes..

Ok we did learn that the max file size that the camera will record video is 4 Gig, It has the 16 Gig card, and can record all the way till it's full. but it can not do it in just one giant file. But if you make it shoot like 30 minute blocks of video, the camera will be able to use all 16 gigs of the SD card.

Like we once set it to automatically take a picture every 15 seconds. and it did perfectly. I also took all those pictures and made a movie from them each image is there for 1/2 a second. pretty cool, it's at,

http://www.youtube.com/watch?v=c2ts4J7p2hs&

What the scrip did was more or less all on it's own press the shutter button every 15 seconds. and do it till we tell it to stop.

We are hopeing that a similar script will do the same but in the Video mode. The simple script we used to take pictures every 15 seconds. I just tried it in the camera and it still works great, but when the camera is in video mode, you see the script try to do something every 15 seconds,,, but nothing actually happens. tHERE PROBABLY IS A DIFFERENT WORDING YOU USE WHEN IT'S IN VIEDO MODE. BECAUSE YOU CAN CONTROL EVERYTHING IN THESE CAMERAS WITH THOSE SCRIPTS.THEY SAY IN THE FORUMS. IF IT IS SOMETHING YOU CAN DO BY PRESSING A BUTTON, THEN IT CAN BE DONE WITH A SCRIPT. f STOPS EXPOSEURES, TURN DISPLAYS ON OFF ALL SORSTS ANYTHING YOU CAN DO WITH PRESSING BUTTONS YOU CAN MAKE IT DO WITH THE SCRIPTS. IF YOU KNOW HOW TO WRITE THE SCRIPT THAT IS.. Wow caplock sorry gang he he he....

But what we need it to adapt one that when the camera is in video mode, the code does the equivalent of press the shutter button, (this starts the video recording) wait 30 minutes, press the shutter button again (this stops the video recording and the camera saves the file to the card) so after this second pressing we have it wait a minute to make sure it had plenty of time to close the file, and then it presses the button again and the same process starts all over again. wait another 30 min, then press button again bla bla bla.

This is for a Canon Powershot A560

Anyone willing to take a stab at this? I'm guessing for testing
purposes the full 30 min is not needed say like 5 min record 1 min
store, 5 min record, 1 min store etc. can change the 5 min to 30 later.

anyone?

I've modified the intervalometer script and the USB remote shutter. I've
been experimenting with using a BalloonSat flight computer trigger the
camera (A560).

I'd like to give the flight computer over when pictures are recorded.

It's neat stuff, I'm starting an articler for N&V about CHDK.

Hi Guys,

The PARIS project has little to do with France - instead, it's intended
carry a paper glider - APRS equipped - on a balloon and to release it at
a predetermined altitude.

This piece describes the team's effort to develop a mechanical barometically
activated release mechanism. Their best shot was to use a partially filled
hypodermic syringe rather than a surplus VIZ anaeroid bellows. It didn't
work so well, but what's eye-popping is the altitude chamber they tested it
in. Maybe they haven't heard of VIZ or Harbor Freight Tools? Or the EOSS
barometrically-armed fast release device ...

7201. BASE 43 is still a go

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-10 03:58:49 UTC
From: BASE
Topic: 7201 Message: 7201

Dear friends,

Everything is looking good for our launch on Thursday, 10 June from Bowman Park on the DePauw Campus. Launch will occur shortly after 12:30 UTC. The launch is being held during Alumni Weekend and may be delayed for audience questions.

Attempted ascent rate between 1000 and 1100 ft/min (5 meters/sec). Using a 1200 gram Kaymont/Totex with helium and a payload weight of 6 pounds. Primary payload are two energy discriminating geiger counters. Also carrying a DXG 506-V video camera to take picture of ground (including crowd at launch).

Predicted landing near Elizabethtown, IN approx. 65 miles downrange at a heading of 120 degrees.

Primary data and radio on 900 MHz spread spectrum. APRS should be under W9YJ-11 on 144.39 MHz every two minutes with no path.

Thanks for your support,
Howard

7202. BASE 43 essentially complete

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-10 23:37:24 UTC
From: BASE
Topic: 7202 Message: 7202

Dear friends,

BASE 43 was a good flight today. Released into calm clear skies at 12:52 UTC. Maximum altitude of 95,000 feet. Troposphere jet stream was a little slower than the models, lower stratosphere winds were stronger. This combination led to landing about 10 miles northwest of the prediction. Flight string successfully captured by the top of an 80 foot tree.

The property owner is very friendly. He had already scheduled a tree cutter to come next week and remove two dead trees. He is confident that the cutter will be able to extract the payloads, if the thunderstorms this weekend don't do the job first.

Additional details will be posted on the www.depauw.edu/acad/physics/base web pages.

Thanks for your support and interest.

Howard

7203. Field Day balloon

Yahoo group: GPSL (2009 — 2010)

From: Roger Hammond
Topic: 7203 Message: 7203

The Grand Island, NE amateur radio club is joining forces with a couple of surrounding cities, Kearney and Hastings, for Field Day this year. They've asked me to do an ARHAB demo. I have some small 100 gram balloons that I'm considering launching with a CW only beacon on it. Something reasonably inexpensive that I don't have to worry about chasing or retrieving. The beacon I've come up with is made from a PICAXE processor with one of those $4 sparkfun UHF transmitters. Unfortunately, it sounds best on AM. I'm looking for something cheap, disposable, but effective. Any thoughts?

> The beacon I've come up with is made from a PICAXE processor with
> one of those $4 sparkfun UHF transmitters. Unfortunately, it
> sounds best on AM.

Because the FM component is incidental, the range will not
be nearly as good as with AM. A narrower bandwidth such as
is common with AM, or better yet CW, will help the range a lot,
but unfortunately these UHF transmitters do not have anywhere
near the stability that a crystal-controlled oscillator
would attain.

The PICAXE part is good for its fairly low cost and excellent
speed to develop an application (wondering how much advance
notice you had for this request). Only a raw PIC, Atmel, or
similar low pin count microcontroller would be cheaper at under
a dollar.

> I'm looking for something cheap, disposable, but effective. Any
> thoughts?

Absolutely!

At Skyquest we've launched nothing but expendables and all
transmitted data (temp and sometimes pressure). All fell in
the ocean and all were lost; no attempt made to recover any
of them

Although we usually used better, real transmitters, I was
amazed at the range that a simple clock oscillator would
provide on 10 meters SSB when we tried one once. These are
in the dollar price range and can be less than that if
surplus.

There is at least one standard clock frequency that covers
both 10 meters and 2 meters. As I remember I did not have the
chance to listen on 2 meters, but the balloon and signal lasted
so long on 10 meters (maybe 4 hours) I finally stopped listening
to it so don't know how long it took to either land or run
out of power.

For a battery suggest you use either a 9 volt alkaline or
lithium, or just some AA alkalines soldered together or in
a plastic holder. I know soldering alkalines without tab
terminals is not ideal, but with a little extra paste
flux applied and attention to soldering as quickly as
possible, perhaps with a damp cloth or paper towel around
the cell end to sink heat, it can be done without damaging

the cell.

For antenna I used a full length dipole of 5 meters length,
with half (about 8 feet) going up the balloon load line and
half hanging down.

Feel free to email me on or off list for more info about light
expendable transmitters.

Hank
Skyquest (Massachusetts)

That's a standard size "transistor radio" 9 volt battery
available as a primary lithium (not rechargeable).

The predominant brand, as far as retail availability goes,
is Ultralife, which used to, and may still be available,
at Radio Shack retail stores.

Roger....The SparkFun 434 MHz modules do indeed sound best on AM when modulating them, I have mine doing RTTY and also DominoEX....but they do have some FM component to them, although very weak deviation. If you insulate them well, you can run them as a straight CW transmitter which works great for tracking as you also can pick it up on an FM receiver as an on/off carrier for DFing....although when receiving in CW mode be prepared to tune around since they can drift a few kHz. I use my Kenwood TH-F6A multi-mode handheld in the car and in the field when DFing this.

I have some info and a program to do CW and also AM modulated CW on the SparkFun 434 module using an Arduino board on my website under the "Payload Designs" link.

http://www.wb8elk.com

I'm planning to fly just such a setup this weekend as an ozonesonde hitchhiker since the whole thing including the 9-volt lithium battery weighs just 3 ounces....I put a lightweight wooden dowel rod on it for a vertical wire dipole and wrap the transmitter and battery with 3 layers of small-cell bubblewrap....the large-cell bubble wrap bursts but the small-cell stuff works just fine and makes for a very lightweight payload. My tests show that it'll stay above freezing this way due to the solar greenhouse effect...particularly if you wrap everything with black duct inside.

I'm planning a Field Day launch with a simplex repeater on 144.34 MHz from Huntsville, AL...probably around 1 pm on Saturday of Field Day.

The Grand Island, NE amateur radio club is joining forces with a couple of surrounding cities, Kearney and Hastings, for Field Day this year. They've asked me to do an ARHAB demo. I have some small 100 gram balloons that I'm considering launching with a CW only beacon on it. Something reasonably inexpensive that I don't have to worry about chasing or retrieving. The beacon I've come up with is made from a PICAXE processor with one of those $4 sparkfun UHF transmitters. Unfortunately, it sounds best on AM. I'm looking for something cheap, disposable, but effective. Any thoughts?

Could you tug at the UHF modules a bit by modulating a varactor on the
output with a square/PWM output from the uC?

The cheapest source of the Ultralife Lithium 9-volt battery that I use for SparkFun transmitter beacon is from Lowes near their smoke alarm section....about half the price that you would find at Rad Shack.

Bill and Zack,

I think I still have a few 9 V Lithiums leftover from when I was doing larger APRS flights, which I'd like to return to if I ever get some time to build some more goodies. Thanks for the tip on the lower priced 9 volts. Zack, if I had a little more time I'd pick your brain on what your recommending I try. Unfortunately, I'm out of town most of next week and will probably have to stick to the CW beacon and listen on 433-something MHz AM.

Thanks all for the information, thus far.

What about using a TTL oscillator that you could get from a junk video card. Something like 28.322 or 14.320 or what would have a primary or secondary land in the ham band. Then cut the antenna for the frequency you want to use.

7213. Helium Orders and Conference Pre-pay

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-13 01:50:16 UTC
From: Zack Clobes
Topic: 7213 Message: 7213

I have all of the prices finalized for Helium and the conference.

The final cost of gas came in a higher than was orignally posted on the web, although that's a bit mis-leading. The price originally posted was basically the base price of the gas, but the price to pay includes gas, tax, hazardous material charge, delivery/pickup, and a small bit to cover the credit card charge to Google Checkout. I hope that you understand - I'm not here to make money but, but I'm trying not to lose any either.. :-)

Without further ado...
http://www.custom-ds.com/gpsl2010

Regarding the $20 conference fee, once you add it to your cart, you can alter the quantity (for example, if the group wants to pay as a whole, or husband/wife/child combinations). I will follow up individually with the purchases to find out specifically who the payments are for.

Paul,

Nice job with this flying gizmo.

The video also looks nice.

I believe there is at least one mistake, though, in the script
regarding rotation of the craft around 2:30 of the video.
I think if you listen carefully you'll know what I'm
talking about.

Since you often interact with students, I hope you can correct
that flaw.

Has anyone ever presented a GPSL talk specifically about their techniques and experience with hydrogen?

I know Joe is an old hand at hydrogen (I think 100% of NSSL flights with H2), and I think it's been used at GPSL before, but wondering about whether a talk or Q + A has ever been done before.

Might be something to think about for this year.

When does a schedule of talks usually get firmed up and posted?

Hi all,

When using hydrogen, the tank requires a different thread for regulator attachment versus helium and at the time I bought my H setup the vendor strongly recommended using a regulator made for hydrogen use. I can provide my fill system to Paul and others.
6% more lift per volume and cheaper than He plus it is a good choice to keep the crowds away during filling.....

Hi Pete,

EOSS has abandoned use of a regulator in its He fill rig. Too many problems with it freezing up in humid conditions. We now use just the tank valve to control fill flow rate. Now, I know that cracking a tank valve into open air can ignite a flame, and even if it's connected to a fill hose that's full of air, one may hear a "pop" as that incipient flame consumes the nearby air in the hose. But does a regulator confer any special safety or other benefit when used with H2?

BTW, I think a K bottle contains about 195 SCF of He and 295 in a T.

Hi Mike,

If I were to guess as to why a special regulator for Hydrogen would probably be towards leak resistance. Because of Hydrogen's small molecular size it could leak out of a quote 'gas tight' system made for other gases. Plus I think they use a stainless steel diaphragm because it can dissolve into some metals. It could make some metals brittle.....

Some notes;

 I worry about self heating when it is released which could cause ignition (0.02 millijoules is all it takes with a air mixture from 4% to 74%) This is the reason you can get a nearly invisible flame from just 'cracking the valve to clean it' the reason I fill at a low rate.

To reduce static discharge as an ignition source I bond the tank, to the fill nozzle attachment point and earth ground with a bare wire. Not trying to bleed off any charge but to insure no voltage gradient is present. I then 'bond on' at the tank before I move to hold the nozzle. I also stay under the envelope when working to tie it off, in no case anyone is allowed to touch the envelope out of static fear.....actually if the hydrogen is pure, it should not explode inside the envelope, but who wants to ruin a good balloon day by chance??

Before I started using hydrogen I visited a FAA wx station and looked at their equipment for filling and releasing balloons. The one at Dodge City, KS used a separate concrete block building with an automatic fill system operated from a separate room. Once the balloon is filled the operator then goes into the room to tie it off, attach the payload, and open a large door for walking it outside to release. A fair amount of electrical bonding was done if I remember correctly. I think they thought I was a little crazy at the time for wanting to use hydrogen instead of He,,,,,but now with the prices.....

Maybe a demo of hydrogen use at GPSL, like from the Mr. Wizard days. What will really happen if we had a static discharge on the envelope. Or where will the fireball go after ignition???? Maybe the Myth busters have done this.

From: Mike Manes
Topic: 7214 Message: 7229

Hi Pete,

Some of us in EOSS began looking into converting to H2 a few years ago. We learned about the puny ignition energy and static discharge precautions, as well as what Joe WA9SBD has done to achieve over 50 safe fills during his 20 years of ballooning.

Expanding gas experiences adiabatic cooling, and that's what caused our He regulators to freeze up, causing frustrating launch delays. However, the intense vortexes created when passing 2300 PSI H2 directly into the atmosphere have very high pressure and temperature hypersonic cores which I suspect can cause ignition. And this phenomenon is well known in the petroleum industry, which prohibits open compressed H2 valve cracking. But the pop that occurs inside an attached line is benign, albeit alarming to those who don't expect it; once it's consumed the nearby O2, it's over.

The largest impediment to our conversion has frankly been the "Hindenberg Effect" - so we'll just bide our time until the cost of He soars higher than our balloons.

I applaud the idea of session at the 2010 GPSL on how to use H2 for fill gas safely. If one was done during the past two GPSLs, I regret missing it.

BTW, I've been told that all NWS RAOB sites, even those near Amarillo, have switched to H2 due to the soaring cost of He. The blockhouse structure used for RAOB filling is more of a precaution against accumulated H2 due to slow leaks from the bottles stored in there than to the possibility of ignition attributable to the fill process. Since we store our gas and do our fills outside on the ground, we just need to provide ground bonding on the fill rig.

I have the adapter, I would just like to do my first H2 fill with someone
who has expereince.

Zack, I saw your message about first public H2 fills at GPSL. How would you
fell if I filled with a crew who had already done an H2 fill?

The record has been 10.

I remember thinking what a record it was for GPSL 2001, we had three
balloons going up.

I have 12 groups that have stated that they are flying, and I believe at least one of the groups will be flying two balloons.

I currently have 6 tanks of gas paid for.

Once you've clicked the checkout option, you should have a subtotal. Once you're at the next screen, you should be prompted to either log into your Google (Checkout) account, or create a new account.

7239. Syntra, foamed PVC

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-14 18:46:05 UTC
From: L. Paul Verhage
Topic: 7239 Message: 7239

I ran a thermal test this weekend on a 1/8 inch thick sheet of Syntra. After having a plastic zip tie break in near space, I wanted to test if Syntra gets brittle at cold temperatures. After sitting in a styrofoam box with dry ice for over an hour, the Syntra was still flexible and did not break when I bent it.

I would be curious to know if this is the experience of other people. I'm planning to use Syntra brackets in near sapce applications. For my upcoming mission, they will hold a $150 camera to the near spacecraft. Near space forbid that bracket break from post-burst choas (PBC).

Hi Bill,

The balloonatics reflector stripped your attached pix. Got a link?
BTW, I guess landing in a cathouse beats a buffalo or horse corral :=).

Still drying out from the rainy launch of EOSS-151 & -152. Seems "a little more gas" i.e., an extra 3 lb of neck lift, doesn't quite do it to compensate for water weight collected on a 3000 gm bag and 10 ft 'chute, but 6 lb did it OK, albeit with just a 70K' burst on -152, after passing -151 at about 40K'.

Who on this list hasn't done that? he he he..

How about make it a real challenge like do everything they say you must
do and do it for less than 50 bucks.

even that would be easy.

tOO BAD THEY CANT TAKE THE EXACT SAME RULES OF 101 AND APPLY THEM.

WEIGHT,, DENSITIES ETC. IF IT'S LIKE AN EXEMPT BALLOON FLIGHT, IT'S
FINE TO FLY. WHY SHOULD IT MAKE ANY DIFFERENCE? Crap caplock sorry gang.

But anyway, if the spec's for 1201 on the sizes and densities are good
enough for a plane to crash into. if a plane was just as light and or
dense whats the difference?

Nowhere in the UAS NPRM could I find any reference to Part 101 or balloons,
for that matter. I'm guessing that the UAS guys may not be aware of 101.

All the proposed rules seem to assume powered, ground-launched flight, but
that's not explicitly specified.

The rules do need some work, and maybe this pressure will get 'em off the
dime.

Hi Jerry,

Yes...I've been helping the Makers 256 Local team here in Huntsville AL for the Hackers Spaces in Space competition. We just did our second test flight this past Saturday....Bill WB8ELK

Story follows with photo of the recovery attached:

> I flew a low-power (10 milliwatt) version of my multi-mode tracker on 144.34 MHz running DominoEX22 and 300 baud ASCII RTTY.....total payload weight of 4.5 ounces. In addition we flew a small camera payload for the local Makers Local 256 club all attached to the weekly ozonesonde from the NSSTC building near UAH-Huntsville
>
> Shane N4XWC, Barry N4MSJ, members of the Makers Local 256 club and I set out to chase....we could see the balloon visually during a good deal of the flight since it wasn't traveling very fast and we could keep close to it during the flight.
>
> It burst around 101,000 feet and only landed a mile southwest of the burst point right in downtown Decatur, AL. It was about a mile NW of Point Mallard park and a half mile south of the TN River. Donna Avenue just north of Harrison St.
>
> Although weak and being directly under the balloon in the cone of silence for a vertical antenna, we still had enough signal to get most of the DominoEX signal to keep track of the balloon position. My home station was decoding the 300 baud ASCII RTTY signal and uploading that info to the http://spacenear.us/tracker website which plotted to a Google Map.
>
> I lost half my antenna at burst but still could copy a few weak position reports a couple of minutes before landing which helped narrow the search zone on the east side of Decatur. When we were about a half mile away, Barry N4MSJ was able to DF the ozonesonde signal which allowed us to get close enough to copy the DominoEX signal on 2m to decode the final lat/lon position.
>
> It turned out that the payloads had dropped into a woman's backyard off of Donna Avenue right next to her cathouse. She has a large outbuilding and fence covering about a good portion of her yard as a cat sanctuary for two wild cats that she didn't want roaming the neighborhood after she moved to the city from the country. Her cat "Tom" seemed particularly interested in the buzzing ozonesonde sitting right next to his fenced in sanctuary.....photo of the landing site (myself and the Makers 256 team holding the payloads). The Makers 256 club is participating in a competition called Hacker Spaces in Space to take photos in Near Space as economically as possible.
>
> You meet some interesting people when you drop things on them from 20 miles up.
>
> - Bill WB8ELK

>
> PS...landing site coordinate: 34d 35.18m, -086d 57.45m

Have any of you been approached by anyone competing the "Hackers in Space Challenge" (http://workshop88.com/space/)?
They are sponsoring a challenge between hackerspaces to launch a balloon with <4lb payload for under $250.
Might be a place to introduce some new people to GPSL.

7255. Re: [GPSL] GPSL T-Shirts

I had a idea for the t-shirts.

How about (just fill in the correct amount)

A picture of the edge of space with past GPSL dates overlaid on the front
Under that these words
$100 for the gas

$100 for the balloon

$400 for the electronics

See back!

Then on the back a picture of some team that recovered there package with these words under it.

GPSL 2010 Priceless

Quite a few of us already "spread our knowledge" to others in a variety of ways. NSV for example teaches a Near Space class for the Boys and Girls Clubs of KC, we also have been doing launches for the Boy Scouts at a variety of levels (Cub, Boy, Venturing) for over 5 years.
Bill Brown literally travels the country doing this. EOSS has more experience than almost any of us. On top of that GPSL is going into its 10th year.

Maybe they should join us at what we have all been doing for a long time now. My question is what's in it for them, why are the doing this now?

I am really looking at this as someone only marginally connected to the hackerspace community and GPSL. Hackerspaces (more info: http://hackerspaces.org) are basically community places where people come to work and collaborate on projects. It's a nice way to get access to equipment you may not have. The one I have been to a few times is pretty disorganized but it is working on it. This Hackers in Space was a challenge put out by one of these spaces to challenge the others. I'm pretty sure it was inspired by the MIT students that got the publicity a while back.

As far as them joining you, that was what I had in the back of my mind. Maybe not have the contest flights at GPSL but coordinated with GPSL would be something of interest to both parties. It could raise public awareness for both groups and I think it would be fun if 10 or 15 groups could launch balloons on this challenge at GPSL. You could set future challenges that will be more of a stretch. Maybe have different challenge levels.

I would be interested to see if they're interested in BalloonSats. They are an easy way to send experiments into near space.

There's a group in KC that meets underground. I'm interested in joining them, but for a 90 minute drive and $35/month membership, it ain't goin' happen as a student. It's a neat idea though, it makes me wish I were still in Idaho as the Reuseumm is attmepting something similar.

7261. Re: [GPSL] Hackers in Space

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-15 19:13:50 UTC
From: wb8elk@aol.com
Topic: 7247 Message: 7261

Our local group here in Huntsville is called Makers Local 256. They have a lab space in downtown Huntsville with metal working equipment and electronic test equipment. That's the group I helped to fly their camera last weekend as a test flight for the Hackers Spaces in Space competition. They all enjoyed the launch and really enjoyed the chase....they are enthusiastic and talented and I'll probably get some of them interested in helping out with some of my future launches.

Contacting these folks is a great way to add some new talent to your balloon groups. Although many of them work as computer programmers, EE's or ME's or are students in those fields, very few of them have actually seen ham radio in action....I think after this last flight I may have some more ham radio converts in the works.

They are sponsoring a challenge between hackerspaces to launch a balloon with <4lb payload for under $250.
Might be a place to introduce some new people to GPSL.

What's really funny?

I started to look around about these folk. And off the top of my head, it's pretty cool. It's world wide and actually very BIG! I then found a search page where you can look for local to you groups. And There are 4 here in Wisconsin. 2 in Milwaukee, 1 in Madison, (The capital) and 1 in La Crosse (a large western town, LOTS of colleges, 4 of them)

But I noticed on thing about all four. They all are looking for members, Ok cool.. but all four make it impossible to contact them about anything, never mind becoming a member. Not one had a "Contact Us" link or anything. Are these guys soo geeky that they don't understand a simple link so people that they want to join actually can?

Just sooo funny..

7263. Re: [GPSL] Hackers in Space

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-16 00:32:39 UTC
From: Jerry Gable
Topic: 7247 Message: 7263

In Phoenix there is one, Heatsync labs. Their website pretty much says when they have meetings and encourage you to come to a few before you join. I went and wandered around the place and nobody said anything to me. One other person looked lost so I talked to him. It turned out he was the guest speaker for the night. After a while someone came by and said hello. Three of the board members were there the whole time but didn't look up from their computers while we were wandering around.

As people showed up I talked with them and almost nobody pays for anything. They also seem to be easily distracted by shinny objects. Every week they seem to be doing something different.

As you said it was a great idea but communication skills and growing paying members seems low on the list of priority.

> I would be interested in flying with hydrogen at GPSL this year.

Has anyone ever presented a GPSL talk specifically about their techniques and experience with hydrogen?

I know Joe is an old hand at hydrogen (I think 100% of NSSL flights with H2), and I think it's been used at GPSL before, but wondering about whether a talk or Q + A has ever been done before.

Might be something to think about for this year.

When does a schedule of talks usually get firmed up and posted?

Hank

Those figures are a tad high for tightwad exempt flight - but don't
neglect the cost to refill your gas tank after fetching all that stuff
back (except for the balloon and fill gas) - it adds up.

Okay, here's the t-shirt design. I wanted to get this knocked off as quickly as possible, so last night I used a different picture for the back. It's one that is appropriate for near sapce recovery.

It definitely looks like it might help if there can be something
worked out or organized to help out Paul this year at GPSL.

How about trying to make hydrogen a *formal* (on the agenda)
part of GPSL 2011 before April and May 2011 roll around?

Maybe at least a demo launch, possibly more, like a brief
show-and-tell presentation.

Hank

Typically, we put the site of the current year's meeting on the front with the ARHAB logo and the callsign. The back has the previous years' launch sites (which may be slightly different than where the meeting occurs). The reason for the difference is that sometimes we change the launch site after the shirt design has to go final.

I think it would be good to break from tradition and show the current year on the back too.

The 20009 :) T-shirt somewhat implies 2008 was the last event when viewed from the back. The font on the front is much smaller so it is not so apparent it was from 20009.

My $0.02

Technically, we've never launched out of Hutchinson, but I hosted us here in both 2004 and 2006.

We launched from McPherson in 2004, and Lyons in 2006.

Not sure how you want to handle that. I'll proudly take Hutchinson for both years on my T-Shirt though.. ;-)

We should change 2003 from Deer Creek to Denver, if we want to use host cities. I'll add Hutch twice.

Paul,

This is one of the many thankless jobs you've undertaken,
but I urge you to not rush the design *that* much (tomorrow
to Zazzle).

Heck, you brought the idea up of specific designs only
seven days ago.

How about taking into consideration that most people
are not even reading all this GPSL email during the
day and/or able to reply during the day?

If it's possible, even just a few more days until the design
is committed would be a little more considerate of all
concerned.

Hank

I agree! We still have a month.
Give it more time for input.

One comment on the pic on the back.
It's not real clear what that is a pic of unless you are involved in ARHAB.
I think an inflated balloon at launch would stand out more.

My exact impression, too.

> I think an inflated balloon at launch would stand out
> more.

Yes, and I'm sure other images with much less *visual clutter*
than the present selection are around, but a balloon is
certainly one possibility.

Admittedly I haven't read through all of these posts and haven't seen it mentioned...but the Topeka, KS date on the back of the shirt is quite a ways in the future!

20009 is what it shows. [?]

7285. Pre-payment

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-16 20:05:40 UTC
From: zclobes@gmail.com
Topic: 7285 Message: 7285

I've had a couple of questions regarding paying for Symposium admission at the door. Yes, you may pay when get to Hutchinson, and if you are at all unsure if you will make it, that is still the best option.

Pre-payment obviously has its advantages though:
* It's faster - you'll have a badge already printed with your name.
* You won't have to wait in line to sign in, so you'll get first dibs on the breakfast spread.
* Don't have to worry about having cash or check on you Friday morning.
* You can pay with credit/debit cards.
* It gives me a more firm number of how many will attend.
* It allows me to make deposits and buy supplies ahead of time.

Gas purchases on the other hand need to be placed ahead of time, as we need to insure that the supplier has the necessary gas on hand.

Thanks,
Zack

Hi Mark,

Here's a video of how JP Aerospace does bag launches:

http://www.youtube.com/johnmpowell#p/u/5/mCwOYV9gHn0

Go to http://jpaerospace.com/ and click on Videos.

There's also a video of how they developed and built the launch bag.

From: Nicholas
Topic: 7268 Message: 7296

Paul, I plan on launching with H2 and was thinking about launching two balloons but I could just launch 1 balloon and help you launch a balloon.

There is one possible complication and that is I will be conducting a plant test in Oklahoma that week and may not be back to Topeka till Friday night. And under the worst condition I may have to stay at the plant over the weekend. Last year's test went well and hopefully this year will be a repeat but I can't guarantee that I will be there.

Paul you are welcome to call me and we can discuss it more if you would like.

Hey harry,

Congrats on figuring it out for yourself.

I don't handle that program it's the guys from Near Space

http://nearspaceventures.com/cgi-bin/index.cgi

you might drop them a line and suggest their program accept a leading zero.
I bet lots of folks do what you did.

CU next month.

Hi Ron,

The Garmin should work up to any altitude that we can manage with latex balloons. I've had mine up to nearly 119,000 feet before. The Inventek GPS board that I'm currently using will work to 135,000 feet.

If it worked at 105K feet you are probably OK. The problem usually discussed is the 60K feet limit that some units have. The DOD has a rule about >60K feet or greater than something like 900MPH. You are supposed to be able to exceed 1 but not both limits. Some units cut off if either is exceeded. I have seen units based on the SiRF III chipset do this.

The only SiRF III chipset that I'm aware of that works above 60,000 feet is the Inventek module with the special high altitude balloon firmware. I've test flown this module dozens of times over the past 2 or 3 years with excellent results....particularly when matched up with a Sarantel helix antenna (with built-in preamp). There are other Kalman Filter limits at 78,000 and 135,000 feet depending on how the manufacturer does the filtering algorithm....this is why some units that make it past the DoD 60,000 feet limit sometimes stop at 78,000 feet. For those using the Trimble Copernicus, the default "Land" setting stops at 27,000 feet....in "AIR" Mode it will work well above 100,000 feet. One cheap unit (think it was from Radio Shack?) that was tested a few years ago stopped at 32767 feet since they didn't want to take up more memory space on their microcontroller for the altitude. These are some of the things to look for when choosing a GPS receiver for balloons. Due to the extreme costs of a GPS RF simulator, the most cost-effective way to test them out is to actually fly them (but I'd recommend sending up a known good GPS unit along with it as a backup).

I'm waiting for my last revision of my GPS board that has the Inventek module and the Sarantel antenna all in one board, I've added battery backup and the ability to choose between inverted or non-inverted serial output depending on whether you're using it directly into a microcontroller or something like the Byonics Microtrak. I've tested it out with the Microtrak on several flights and it locks on within 90 seconds from a cold start. With the battery backup, it'll do hot starts in less then a second provided it has been on less than 2 hours previously. The Sarantel helical antenna does seem to eliminate lock problems during a rapid spinning payload (or even an inverted payload) as sometimes happens during a tangled flight train during descent. It works better under these conditions than my previous tests with a patch antenna.

The GPS board will be available in mid-July at: www.elktronics.com I will also have the complete Multi-Mode Tracker available at about the same time that incorporates the Inventek GPS module and Sarantel antenna along with a frequency agile transmitter that can be put on 2m or any frequency below that all the way down to 1.8 MHz.

I will try to have some assembled units ready so I can bring them to GPSL this year for anyone interested.

Right now it does DominoEX (my favorite weak signal mode), RTTY (I particularly like 8-bit ASCII RTTY at 300 baud), CW, Hellscreiber and PSK-31. I may have it doing APRS packet by late July....I'm currently writing the code to implement that. It will have the ability to transmit on 144.39 MHz to transmit a position report to the APRS network, then automatically switch to a clear channel frequency such as 144.36 MHz to send out the other weak signal modes.

I always goes with at least 3 pounds positive lift. With too little lift on a large balloon with a light payload, you run the risk of neutral bouyancy. If you take that risk, use a cut down timer to bring everything back.

Adding a little more helium isn't going to impact the max altitude very much. You must increase the initial volume of helium by 100% to reduce the max altitude by 18,000 feet. Variations in the balloon and inaccuracies in weighing lift will swamp small variations in the initial helium dump.

However, adding a little extra helium does effect your ascent rate and therefore your time aloft (which impacts your flight downrange).

So go with the extra helium and get your near spacecraft back sooner.

Paul

Ron,

I've flown with as little as 1 ounce free lift (ran out of helium that time)....however, you run the risk of coming back down with that small of lift and a very extended flight time. For a decent ascent rate of 250 to 400 ft/min, I would run about 7 or 8 ounces of lift with your system. Keep in mind that if your ascent rate stays much below 400 ft/min, you run the chance of doing a several hour floater flight.

Ron,

Bill answered the *question you asked* perfectly, but the idea of what both Bill and Paul mentioned of having a little spare lift is good, valid advice, and your planning to use a little over 2 pounds of free lift already complied with that notion.

Consulting LIFTWIN, it looks as if the "comfort range" for your balloon and payload characteristics would put the free lift in the range of about 1 1/2 to 4 pounds allowing for some margin of error.

Unless for some reason you're trying to gain a very high altitude or and/or economizing on gas expense or having a leisurely, slow flight, maybe think about just a little more fill (3 to 4 pounds) to get a faster ascent speed to get your flight over with and not have the possibility of a slow pinhole leak making a *very* long flight.

What will that light payload be, and are you planning on recovering it?

Hank

What Paul and Bill are saying here sounds quite counter-intuitive, but the statement about a hanging balloon is quite true. At the last GPSL I ran an experiment to track the internal balloon pressure during the flight. The results were surprising to me personally. However, they coincided with findings voiced by Cait, Jules and Amy from UofMN (from memory - ??) where they shared a quick comment about strange data on balloon pressure. My results in the flight that followed the next day reflected strong similarities to their comments.

From this I concluded that the Latex the balloon is made of is not made from a "completely" linear expansion material. If it were, you could go with the minimum lift to get max altitude. However, the latex goes through an initial high-resistance stretching phase at inflation to first few thousand feet where the helium pressure reduces greatly, and goes up relative to the reluctance of the latex to initially stretch. Shortly after, the Latex becomes more relaxed in it's resistance to stretching, and this is where the balloon goes through its' nearly linear expansion phase to the maximum increase in diameter. Here we even find a vacuum being present at the fill nozzle for much of the flight in my case, as most of the helium is providing max pressure against the balloon top and sides, and the balloon is stretching very, very easily. Here is the war between a compressible gas and the mechanical resistance to stretch the Latex material, where the Latex is stretching easily and near constantly. This near linear area of expansion is the case for probably greater than 95% of the balloon ascent. As the balloon reaches maximum diameter, the balloon's latex reaches a point of resistance to any more expansion ("Captain, she can't take it anymore!") and there is a sharp increase in the helium pressure due to the resistance to stretching, and the balloon finally bursts.

However, if there is not enough helium, the gas compresses slightly at this point due to the mechanical resistance to expansion by the balloon. And with a slow ascent rate, you can easily achieve neutral buoyancy. One would think this whole process is linear due to the near linear flight profile, but the mechanical stretch resistance phenomenon is there at lift-off and just before burst. The pressure profile looks similar to the back of a two-hump camel with a great distance between the humps. So if you inflate for minimum lift and the balloon ascends lightly, it may never burst due to not having enough compression pressure to overcome the mechanical resistance of the latex at altitude, and therefore the buoyancy created by displacement is no longer a constant because the displacement increase is no longer happening. This creates the floater and you will need a cut-down device to bring the payload down, or wait for the helium to jump outside the Latex enough (days?) to start the descent.

I believe a good example of how difficult it is for the balloon to initially expand can be seen by trying to blow up a balloon. That initial huff can be very difficult.

I believe the reason is that the balloon has its minimium diameter, and therefore the skin tension creates the greatest component of inward force. As the balloon expands, every square of balloon surface becomes flatter, meaning there's a smaller component of skin tension directed inwards.

I have a long story to tell about why I don't have that data, but let's kill the essay here and say "I wish I did have exact data". My data was only recorded by me by hand and then only sporadically, thinking the numbers were bogus, while listening to the very confused voice beacon. We had many problems that flight... We temporarily could not find the planned landing destination for the payload for a over week, :) in which time the processor re-started a few times and recorded over EEPROM data...

I never did calibrate the pressure sensors, so the numbers I recorded are only relative. Here is the extent of what I have in short:

The initial inflation resulted in the relative numbers going from 0 to just over 50 during the initial ascent phase ~1Kft) and then decreasing down to 0 for a lot of the flight (maybe between 30K-60K or so?). After 60K, my GPS went off in the weeds (Copernicus without "Air" option selected...) Before burst (estimated 110Kft or so) the numbers went up to about 25-28 and then burst happened.

You can correlate these numbers to the burst claims for the Kaymont 1200G balloon, which I believe bursts at about 1/10 psi which will put you in the ballpark.

This year I hope to fly a similar sensor package at GPSL, the with the pressure sensor rated at a lower sensing value (1/3psi) and the values given will be in direct Kpascals. I just hope she does not get so lost as usual this time.

Michael,

Very interesting regarding the pressure data. Do you have pictures, etc.,
of how you fit the sensor to the balloon, and what sensor you used last year
and what you plan to use this year?

Floating an under-inflated balloon is a concern, as others have mentioned, but I haven't yet seen the following suggestion:

Fill to ~8 oz per Bill, and launch pre-dawn... you'll get the benefit of solar heating to aid in overcoming the ascent rate "knee" that has been observed. In addition, you'll likely have lower winds, which can be important for a leisurely ascent. I know that Bill has managed to "stall" balloons by flying into dusk, and I've seen the ascent slow down dramatically as the sun goes down on the balloon... just do the opposite. Also, if you get a clear day, a balloon being lit up before dawn hits the ground is an awesome sight, in a small, look-at-that-tiny-bright-spot-in-the-sky kind of way.

Subject: [GPSL] GPS receivers not working at very high altitudes?

I'm planning a high altitude attempt and I remember some discussion about GPS receivers not working at very high altitudes? I'm planning to use a Garmin GPS 18 LVC , Manufacturer Part No. 010-00321-56 and a Micro-Track 8000 FA. I flew this tracking system on my first flight and it worked well at 105k. Does anybody know of any problems with this GPS receiver at higher altitudes?

Michael,

I hadn't heard of a pressure rating applied by Kaymont or similar
companies for latex weather balloons. Do you remember where that
figure came from?

I would think to apply a pressure like that with any meaning or utility,
it would have to be a differential pressure between outside or inside;
or perhaps it's just a pressure related to altitude *assuming* some
typical fill volume. If the latter it's not of much use. (This is
why burst is much better specified as a diameter -- all these
uncertainties and variables are eliminated.)

Were you able to measure differential pressure by your setup, or just inside the envelope?

Hank

From: Michael Willett
Topic: 7313 Message: 7324

Yes, the way I measured is by default a differential between the atmosphere and the internal balloon pressure. The sensor is a single ended sensor, located in the atmosphere environment (inside the payload container that is not air-tight). The differential is realized by a port into the balloon environment being compared to the atmosphere where the sensor is located. Realize, the sensor is not an altimeter, where an altimeter measures a constant, captive pressure against a changing atmospheric pressure. Instead we are using a sensor ported to the envelope and exposed to the changing atmospheric pressure where the sensor is located, providing a differential reading between envelope pressure and atmosphere pressure. And you are right, if the sensor was closed on the atmospheric side, it would be of no use for balloon pressure monitoring. That is not the case here.

Everything is approximate. Variations in the balloon material, manufacture, etc., make precise determinations nearly impossible, but we can look at where the stress begins pre-burst and deal with that point as an indicator that burst is imminent.

Here are the bursting points from the Kaymont web site:
http://www.kaymont.com/pages/sounding-balloons.cfm

Represented are the 1200,1500,2000 and 3000 gram balloons. Displacement to weight ratio is the key factor to getting high.

*Diameter at Burst (cm) * 863 944 1054 1300
* Bursting Altitude (km) * 33.2 34.2 35.4 37.9
* Bursting Pressure (hPa) * 7.3 6.3 5.3 3.7

Bursting pressure listed below in that chart from their page is not the pressure inside the balloon. That is the atmospheric pressure at the level of burst. Not the pressure differential. but what the air pressure is at that level.

at 33.2 Km, the air pressure is 7.3 hPa

7326. High altitude flight will be a non-recoverable mission

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-22 23:37:09 UTC
From: k6rpt
Topic: 7326 Message: 7326

This high altitude flight will be a non-recoverable mission and will only be carrying a tracker with no parachute. Every advantage I can possibly achieve to gain a higher altitude will help, time of day to launch, free lift, payload weight . . . Thank you all for sharing your flight experiences. If anybody has any input that could possibly help, please let me know.

-Ron

Ron,

Okay, that additional information on what your goal is
will help everyone know exactly what kind of help you're
looking for.

Now people will be able to make all the suggestions about
teeny advantages that will give a thousand feet and a
thousand feet there of max altitude. :)

By the way, you're back to a pound or less of free lift
IF you want to chance a protracted rise to your record
altitude which might be a complete "bust" if you get
a pinhole leak after hours in the bright sunlight.

It's a gamble to go light, light (low free lift), but it
might pay off.

If you're not a risk taker, stick to 1 1/2 to 2 1/2 pounds
free lift would be my suggestion.

Hank

7328. GFS Data on READY

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-23 00:03:28 UTC
From: HarryM
Topic: 7328 Message: 7328

I was trying to do some predictions for a flight.
I used the Near Space online prediction program
and then I went to READY to get the data and
there are only 5 choices for the 0-180 GFS data
when there are a dozen or so on the NSV predictor.

Where is NSV getting the data? It's not where it used
to be on the READY site. At least I can't find it!

Per LiftWin, you'd need about 3.25 lb neck lift at fill to get 890 fpm
ascent rate. Much less and you risk a stall going off the "Reynolds Cliff".

Hi Michael,

Hey, thanks for that report on the internal pressure behavior of a latex He balloon over a flight. I've always wondered about that. I did expect to see an abrupt rise in pressure just prior to burst, but the gage >vacuum< is a bit of a surprise, since I'd expect the internal pressure in the envelope to be pretty uniform, despite the gas's bouyancy. I wonder if your external reference pressure might have had a bit of dynamic component due to the slipstream or a bit of venturi effect?

I agree, I can never expect a vacuum nature to be on a latex
balloon. on a GIANT PE balloon yes. but once the barely filled state
has passed the latex is stretched. and I really find it very hard to
imagine a vacuum.

what sensor did you use? what was the pressure full scale spec on it? etc.

From: Mike Manes
Topic: 7308 Message: 7333

David's right about solar heating. We saw that once when we filled and
tied off in a dead calm to just float the tare weight before sunrise.
Launch was delayed, however, until well after sunrise, and we were surprised
to observe the tare weight having been lifted steady off the deck and tugging
at the safety line tied to the He bottle.

Not sure if that's due to He solar absorptivity being greater than air or
a consequence of the He being constrained by the envelope. But the effect
is quite real - and so is the converse after sunset.

I'd think that one could find the pressure vs. volume profile of a
latex balloon quite simply by tethering it on the ground or the floor
of a (large) lab. Heck, one could even do it using compressed air,
maybe even from a shop vac, but then one would have to hang to hang
the balloon inverted.

Getting a good static ambient pressure reading (or reference for a
differential reading) while the balloon is ascending can be tricky.
Locating the static pressure port on an aircraft fuselage requires
some cut & try, but of course, the airspeed is a lot greater than
1000 fpm :=P.

H All,

I honestly do not know what we are doing differently than everyone else.
unless it's the H2 factor that it behaved differently than HE does in
these situations?
50 flights in the bag. and out of the 50 maybe 6 or ten at the absolute
MOST have we ever went over 1 pound of extra lift. I bet if we were to
break it down it would work out like this
30 flights 8 ounces extra lift
15 flights 1 pound extra lift
5 flight over 1 pound but never ever over 2 pounds.

And this is all with various payload systems from 300 gram balloons to
2000 grams ones. from payloads that weigh 12 ounces to multiple
payloads that come right up to the 12 pound limit.

and the only stalled floater we have ever had was the Beacon flight,
dead of winter morning launch..

but thats it.

strange?

7336. Is it better to have solar heat or launch pre-dawn?

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-23 05:18:49 UTC
From: k6rpt
Topic: 7336 Message: 7336

The high altitude flight will be K6RPT-14 in the next two or three months. I will announce the flight on GPSL and on ARHAB, the group is California Near Space Project. I'm looking at Liftwin with a 3000g HE, Total Payload .75, Free Lift 1.63, Time to Burst 3.0, Ascent Speed 730, Peak Altitude 133K. Is this conservative enough to avoid a float? I would like to push it to 135K but my free lift would drop to 1.22 and the Ascent Speed would drop to 640. Is it better to have solar heat or launch pre-dawn? My concern would be the possible expansion from solar heat with less lift compared to HE.

As many of you know I am in charge of arranging a group balloon flight this September from a Centennial Celebration for the Boy Scouts. The date is September 25th, 2010, the location is Bonner Springs, Kansas, which is not too far from Kansas City.
I need one more group to help with this launch. So far Near Space Ventures, Paul Verhage, and Bill Brown are scheduled to launch, I need one more. Chase teams are already in place, so I really only need people to launch and then track for the kids.

If you think you might be interested please let me know asap and I'll send you more details.

Thanks...

P.S.
The audience is expected to be about 25,000 youth and adults.

Reynolds Cliff, I like that term.

We get a Reynold's knee at around 40,000 feet. At least its my
understanding after talking to the SSOL in Iowa.

An update of the EOSS data on the change in ascent rate (due to the change in the Reynolds Number for a sphere going from turbulent to laminar flow) that we gave last year□s GPSL in Topeka shows:

- For 1200 g balloons, the average change in ascent rate occurred at 40,301 ft. for four sample with a range from 30,561 ft. to 54,641 ft.) and

- For 3000 g balloons, the average change in ascent rate occurred at 49,881 ft. for 20 samples with a range from 29, 997 ft. to 66,702 ft. with a standard deviation of 8,741 ft.

Nick,

Do you have data for the average total drop in speed after
the knee?

Did you come up with any explanation for the total increase
in speed starting at launch that can sometimes be as great or
greater as the subsequent drop after the knee?

(EOSS-48 data at http://showcase.netins.net/web/wallio/ASCENT.html)

Is any of the EOSS presentation or its results posted on the web?

I think a lot of us unable to attend GPSL would like to see
it.

Hank

Joe,

Just such a "class" was given at GPSL...perhaps the excellent Powerpoint on the Reynolds knee can be uploaded for those that missed the talk.

Maybe a "Class" should be told of what this is and what causes it and why it's called that.

Hank and Bill,

I'll will get with EOSS's crack webmaster Rick get the GPSL presentation from last summer loaded on the website. I'll post a note on this reflector when it's up.

Hank, the average drop in ascent rate was about 31% for the 3000 g balloons and about 28% for the 1200 g balloons. I haven't looked at ascent rate changes just after launch, but I will.

BTW Rick N0KKZ incorporated an ascent rate change into the Balloon Track software that is on the EOSS website. Keith asked for the data to have the online version modified, but I don't know if that's been accomplished or not.

73,

Nick

One fairly usual cause of an ascent rate increase between the near-surface rates and the rates at greater than 2000-4000 ft AGL is a low-level temperature inversion. NSTAR had one flight with a low ascent rate that was as low as 70 ft/min before climbing above the inversion and establishing a ~300 ft/min rate for most of the remainder of the flight. Other, not-so-dramatic differences have been noticed on other flights.

If there is coincident temperature data, you'll usually find the peak of the inversion right at the point where the rates begin to increase.

The altitude and position trends after the payload reads a zero speed are strange. I'm guessing it landed upside down and the GPS doesn't have a good fix? Either that or it landed on a ridge and blew downhill.

From: w0jrt
Topic: 7214 Message: 7348

Just catching up on the GPSL messages...

H2 has been used by some groups at at least the last three GPSL events. At GPSL two years ago (Kansas City) there were at least three balloons filled with H2 (two from one group), plus a demonstration for anyone who wanted to observe.

I think part of the problem is that there was so much harassment a few years ago by the He-only crowd directed at the H2 users that the H2 users now just silently do their thing without drawing attention to their activities.

Could be differences between solar absorbency between He and H2? Got me swingin', Jack. EOSS aims for at least 1000 fpm ascent rate, and we figure the fill based on free lift (gas bubble only) of 115 - 125% of system gross weight. We've only had 1 or 2 latex floaters out of 150 or so, probably due to undetected holes in the skin (meteor damage, huh??).

Interesting. Now the balloon payload has settled in to a reported altitude
of 2639 to 2640'. In clicking on the 'Terrain' button and zooming in the
topo lines show it should be at about that elevation. I'm wondering if
they're on foot going for it. It must be getting dark there by now...

Iowa has easier recovery terrain that there!

From: Mike Manes
Topic: 7336 Message: 7352

Hi Ron,

If you fill in the dark, you'll end up with more lift, a higher ascent rate and lower burst than expected once the He warms up in the sun. But don't tarry too late in the morning, unless you're launching from a site that doesn't experience a rise in wind shortly after sunrise.

Now, some of us have experienced something entirely counter-intuitive with respect to the expected inverse relationship between burst altitude and ascent rate. In EOSS's case, we flew two 3000 gm bags with nearly equal neck loads one morning, but one must have got a fatter fill than the other, resulting in about a 30% difference in ascent rate. Could have been solar heating, since the first filled was the faster one.

So did the faster balloon burst lower? No - it made about 10K' higher than the slow one. One theory is that extended UV exposure during a leisurely ascent may deteriorate the latex - or maybe not.

Who says this is a mature art?

Hi Mike,

I can't imagine that a hour or two difference would make that much difference.

Now manufacturing differences for sure I would believe this, I am surprised as to the lowering of the quality of Totex since when they were the hungry newcomer trying to beat Kaysam.

Now days you can open two balloons and they look different to each other, and then even the balloon itself has many in consistencies in them now. I remember when I first started using them in the 80's they were pure white all the time, and perfectly smooth in color all pure white, not a trace of a teture or any irregularities. now it's the norm.

If extended UV exposure can possibly break down the integrity of the balloon would there be any disadvantages to fly in the middle of the night?

Gang:
At the risk of posting some non-GPSL related data here, I'll share some info on yesterday's flight. Launch was from near Victorville, CA, predicted landing near Barstow, CA.
Scott's very nice tracker worked great on a prior test flight, on the ground, and from the surface to 14k feet MSL. Then, the GPS lost lock. We hypothesized that there was a GPS death ray coming out of Edwards or 29 Palms. Although getting no lat/long, temp, battery voltage and pressure were coming through. We proceeded to a pre-planned interim tracking site, attained visual contact with the balloon through burst. Scott and I separated on a ~2 mile baseline with the hope of receiving packets after the balloon descended lower, under the theorized 'death ray'. Indeed, we got ONE and only one valid packet at about 1000 feet AGL. (It seems likely we had a rapid descent with near 100% shard retention and likely shard/parachute fouling). We made an easy
walk-in recovery, about 0.6 miles from I-15 south of Barstow. Indeed, one of the team members made a visual contact about 0.5 miles away, spotting sun glint off of Scott's radar reflector.

We later learned there was a NOTAM for 'unreliable GPS data' in the vicinity of Edwards. (!)

Despite the efforts of the US Military, this streamlined flight was fun and attained 100% recovery less than half an hour after touchdown.

best

Mark, Can you please give me the specs on the flight train? balloon type, distance from chute, chute to payload etc?

I an gonna try to see if there is a pattern as to the balloon and chute foul ups.

I want to see what others are doing, that we do different.

We have now had 50 flights, and not once had a chute become fouled by the balloon.

Maybe i can learn what we do differently for everyones benefit. Because This seems to be a semi common problem, that we have never ever had hapen to us.

Joe:
A caviat: we need to take the time to look at the pressure v time data to determine the descent rate and then see if the descent rate indeed indicates a fouled chute.

For those like me who were thoroughly confused, Scott had two flights yesterday, one in the morning and one in the evening. Mark's description below is for the morning flight.

bump

I was trying to do some predictions for a flight.
I used the Near Space online prediction program
and then I went to READY to get the data and
there are only 5 choices for the 0-180 GFS data
when there are a dozen or so on the NSV predictor.

Where is NSV getting the data? It's not where it used
to be on the READY site. At least I can't find it!

Hi Joe,

It's not time but temperature - specifically of the He bolus getting hit by sunlight after the fill. And the effect is observable in well less than an hour, at this altitude, at least.

We don't do many 1200's - mainly 3000's for Space Grant, USAFRL, etc, and I haven't seen much change in their appearance. In fact, our last two flights, launched in the rain thru a freezing cloud layer, brought back both shards (the fast release iced up), and the shards looked nice and white, as did both balloons at fill.

Lack of sleep, no see & avoid by other aircraft unless you're carrying a strobe light, and recovery difficulties are all I can think of.

Question for everyone,

What does the radiation curve for UV light look like as you go higher?

There must be a chart someplace i would think?

Per EOSS's GPS gurus, one can get a GPS jammer off the internet for about $100 - some folks use 'em to mess up stolen car trackers, e.g. Not all that tough to make broadband noise on 1.5 GHz. Illegal? You bet! But so is auto theft.

> At the risk of posting some non-GPSL related data here, I'll share some info on yesterday's flight. Launch was from near Victorville, CA, predicted landing near Barstow, CA. Scott's very nice tracker worked great on a prior test flight, on the ground, and from the surface to 14k feet MSL. Then, the GPS lost lock. We hypothesized that there was a GPS death ray coming out of Edwards or 29 Palms. Although getting no lat/long, temp, battery voltage and pressure were coming through. We proceeded to a pre-planned interim tracking site, attained visual contact with the balloon through burst. Scott and I separated on a ~2 mile baseline with the hope of receiving packets after the balloon descended lower, under the theorized 'death ray'. Indeed, we got ONE and only one valid packet at about 1000 feet AGL. (It seems likely we had a rapid descent with near 100% shard retention and likely shard/parachute fouling). We made an easy
> walk-in recovery, about 0.6 miles from I-15 south of Barstow. Indeed, one of the team members made a visual contact about 0.5 miles away, spotting sun glint off of Scott's radar reflector.

Mark,

You also have the following military bases closer to the flight path than Edwards: 29 Palms, China Lake and the Goldstone Deep Space Network. BTW, my quick seat of the pants prediction of the flight was pretty close to the actual landing. A big thanks to our local ham store Gigaparts for letting me commandeer their computer to make the prediction when Scott called me on my cell phone.

Looking at Scott's landing coordinates on APRS.FI, it shows it landed 3600 feet from the prediction I gave him during the ascent.

Joe:
A caviat: we need to take the time to look at the pressure v time data to determine the descent rate and then see if the descent rate indeed indicates a fouled chute.

best

Harry,

Is this the screen you're referring to (attached)? This selects either the latest model run or one of the previous ones. Select the one at the top unless you have a specific reason to want to look at the others.

This is a new feature added to READY in the last few months.

Harry,
I went to this site:
http://ready.arl.noaa.gov/READYcmet.php
I entered my launch location and pressed continue.
This brought me to a page that says READY options menu. I chose the GFS (0-180 hr, 3hrly, Global) from the soundings drop down menu. I pressed Go.
This brought up the page that says choose Meterological Forecast Cycle. There are four choices with the most recent as the first choice. I selected it and pressed Next.
This brought up the page GFS sounding, where you can choose whichever 3hr time interval from the 180 hr window, and make the appropriate choice of full sounding, text only, etc. This screen also has the six-letter access code box. I entered the code, pressed Get Sounding and the text popped up on the next screen. I copied it and entered it into Near Space Ventures right side window and got the expected flight profile. It also worked in Balloon Track as expected.
Hope this helps,Howard

7380. Field Day Balloon from Huntsville AL

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-25 17:29:58 UTC
From: wb8elk@aol.com
Topic: 7378 Message: 7380

I'm launching a balloon here in Huntsville, AL for Field Day....1:00 pm this Saturday.

It'll be carrying a DominoEX22, 300 baud RTTY and CW/Hellscreiber payload on 144.34 MHz FM.

Launch from the NSSTC building in Huntsville: 34.725 -86.646 at 1:00 pm Saturday June 26th.

Predicted landing spot: Huntsville Amateur Radio Club's Field Day site (how's that for balloon mail?)

We'll be hitching a ride on the ozonesonde.

I'll be launching a small 100 gram balloon with an AM Morse Code beacon "KC0MWM Balloon" on 433.925 MHz (+/- drift).

I won't be chasing this one, but would appreciate any signal reports.

Launch will be at 1400 CDT from the southern part of Hastings, NE and expected touchdown is 45 degrees and 48 miles downrange. About 10 - 15 miles north of I-80 near Bradshaw, NE.

Happy Field Day

From: HarryM
Topic: 7328 Message: 7385

Thanks for the info Howard. ARL READY site is where I've always got my data. I hadn't been on their site in over 6 months and their new interface threw me for a loop. I do notice that they did away with the ability to click on the US then a state. There also used to be a sounding screen after clicking on a state that would list several cities.

CU @ GPSL

73 Harry KC5TRB

Sorry to be late in adding the step-by-step. The additional screen as Mark noted was part of the challenge that NSV faced a couple of months ago when ARL made the change. Every time I go through the multiple steps to get my own sounding prediction, I appreciate what Troy has done to make it seem so easy through their website.

Hope to see you at GPSL,
Howard

Hi Keith,

Go to: http://www.arrl.org/field-day-locator

Click on "search by state" and select North Carolina in the State(s)
window. There are 52 FD stations in NC this year, but none are specifically
IN Cary - but you could find one near you from the map on that site.

From: L. Paul Verhage
Topic: 7388 Message: 7390

Yep. I don't care for the tare method, I like to see what's happening.
When there's a breeze blowing, we can gauge the lift and the fluctuations.
Plus, you can change your desired lift on the fly and gauge the amount of
error in lift should you accidentally dump etra gas.

You just need to read upside down.

Paul

PS, I suppose you could use a carrabiner to keep the scale upright.

I use a Rapala I got at Wal-Mart several years ago.
http://www.amazon.com/Rapala-ProGuide-lb-Digital-Scale/dp/B0000AY4L4

They now have one by Berkley for $19.

Here's the final (?) t-shirt front and back. If this is acceptable, could someone take care of the Zazzle setup? I've not played with Zazzle.

From: Jerome Doerrie
Topic: 7395 Message: 7395

Paul, thank you for working on the t-shirt. Since this will be seen by the general public we need to avoid anything that is negative in any way. If the "and all I got was this lousy picture" is removed we have a nice shirt with a postive message.

Wearing this whirt with the "lousy picture" message would generate negative responses from farmers when we want access for our recovery. Many would sy, "you have your lousy pictures, not get off my land." The access issue can be difficult. We don't need to complicate the issues by what we wear.

It will be great to see everyone at GPSL.

I currently have 24 people pre-payed for the GPSL Symposium on Friday!
Thank you very much. As I've said before, it is not required for you to
pre-pay, but it certainly helps me out with numbers and cash-flow. If you
would still like to pay, you can do so at http://www.custom-ds.com/gpsl2010/.
I will be taking this down in a couple of weeks...

As for gas, I have the following orders paid:

1 K He each: Traveler, ORB, Bobette Doerrie, Glen Gram, and Michael Willet.

1 T He each: Base (2 tanks), Nearsys, Glen Gram

1 K H2 each: Near Space Ventures

We will have a couple of extra bottles on-site in case of emergency, but I
do need all other orders placed and pre-paid within the next two weeks. If
you are unable to pay via credit card, please contact me ASAP for
alternative payment methods.

I disagree completely on the negativity generated by the T-Shirt. In fact, quite the opposite.

The wording is a spin on the tourist T-Shirts that are popular in most tourist destinations. "My [family member] went to [favorite vacation spot] and all I got was this lousy T-shirt" can be had at many tourist destinations.

The wording is an obvious irony which the tourist T's and this T design portray well. The picture is no doubt extremely spectacular as are many vacation spots. How few people in the world can say "I sent a vehicle into near space and my creativity resulted in this [lousy] picture." (Obviously the picture is NOT lousy!)

I personally think the whole approach to the land owner makes or breaks the helpfulness one realizes. On an ARBONET flight, our payload landed in the ranch land where the property owner was a bit crusty. I talked to several residents in the area about our problem locating this package. I was offered a horse by one family to ride to the location, was offered a guide by another family that "knew the woods well", was pointed to the ranch owner by the family with the horse and came across the land owner moving his cattle with his truck. He was quite busy, yet dropped everything to then help us locate one of our ground personnel and the package. On the way back out, he shared stories about the Indian tribes that lived there generations before, showed us antiques that where 100's of years old, and was proud to be a part of the "Near Space" adventure. By talking about the experiments and pictures, we were not only welcomed, but ushered all over the ranch area and found the package. I later followed up with an 8x10 picture from near space with our logo and a big thank you which I personally delivered (over 200 miles from my home). The guy was overwhelmingly happy and could not wait to share the trophy with his buddies at the barber shop.I also delivered pics to the horse owner and the prospective guide. I would have loved to have a T-Shirt like Paul has come up with to talk about the envy I have with the balloon going to space and leaving me behind, and the wonderful data and pictures we retrieve from the payloads. Very few people get to be a part of that. This is a huge selling point.

Personally, I think Paul's design of the T-Shirt is great, and obviously our tourist destination is "Near Space" and I greatly appreciate the irony of the wording on the T on such a great picture.

Please note, it is also not required apparel when retrieving one's near space package. I typically wear a T that states I am a member of the NRA and says "I voted for Smith and Wesson" on the back. It helps break the ice. :)

EOSS has always used the tare bag method. It's a lot easier to read, and one can judge the fill progress easily just by hefting the bag. Our balloonmeister has created an easily-filled tare bag and set of measured weights in a 1-2-5 sequence - so if we decide we need an extra 2 lb lift, he just tosses in another 2 lb weight. The inertia of the tare bag also damps out fluctuations in lift induced by variable false lift if there's any wind running.

I got a fish scale at WalMart years ago, works fine. However, it's usually just breezy enough that I don't trust the numbers I see, and the best readings are after the balloon is tied off anyway. With our setup, undoing it all to add more gas is pretty painful. Others can make either the scale or the tare method work, but I haven't found it to be terribly useful.

We typically go off of LiftWin and the tank gage readings to get an approximate gas volume to be used, then add a little beyond that. I'd rather go 200 fpm fast than slow. If we were really wanting to go to the max possible altitude, then I'd arrange to fill inside a building, take the wind lift out of the equation, and get more precise on the lift readings. Pete Sias had a balance bar setup which appeared to give pretty accurate lift readings while still attached to the fill device.

Re: the t-shirt design, I agree with Michael's post. The shirt won't break the deal - if the landowner is torqued enough to deny access, a "lousy picture" quote on the shirt back wasn't what jinxed it.

exactly the same here,

I'll take a picture of outs later but it even gives a visual of how close it's gettinh fopr when it has about a pound to go it changes the way it's sitting. so you can start your fill and walk away and do other things. and just glance at he balloon every now and then to see how close it's geting. no one needs to be even in the area of the balloon for the first 1/2 or so.

Harry, does the Rapala have a hold so once the weight stabilizes it stops reading or does continue to read out the weight. I'm looking for one that will not stop the weighing process once the weight has stabilized.

I will be filling indoors, so wind won't be a problem. I'm going to use tare weights, digital and analog hanging scales. I think it will be a real benefit to see the scale during the fill so you know how close you are to the desired free lift you want.

Ron, the Rapala does not HOLD, it continues to read out.

I have use a one gallon milk jug pre-weighed to the desired weight for the amount of lift that I want. I placard the jug for that desired lift and for optional lift in case I decide to eliminate one of the payloads or I want more lift. I always carry extra water jugs for drinking and washing on the recovery so I can add to the lift jug or just pour some out. I always carry the scale in my flight box in case I need to re-weigh the jug at launch.

73 Harry

Harry, does the Rapala have a hold so once the weight stabilizes it stops reading or does continue to read out the weight. I'm looking for one that will not stop the weighing process once the weight has stabilized.

7410. SABRE-10 complete with lesson learned.

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-28 01:47:14 UTC
From: Bruce Coates
Topic: 7410 Message: 7410
Attachments: 1 described; binary payloads are missing from this source WARC

Hi

When all was said and done, the flight of SABRE-10 should be considered a success but we learned a valuable lesson today.

The day started out poor with heavy overcast and rain. As the launch time approached the skies thankfully cleared but the wind also began to pick up. As we made our usual preparations, things started to go wrong. We unable to do much of our regular prep work the day before because one member of our group was down the flu. As we began to set up, I preformed the required weigh-in and tallied up the ballast weight. Gus started in filling the balloon and I began rigging the payload line. When the balloon was about 30% filled, Gus called me over to show me the dime size hole in the side of the balloon. Unfortunately I hadn't brought a spare with me so I had to drive back home and pick one up. Meanwhile we the covered the hole with duct tape to stem the leak. 15 minutes later I was back with a spare, an extra spare and a pipe. I had always wondered if it would be possible to transfer the Helium from one balloon to another. Well, it's possible but it's so slow, it's completely impractical. We took our lumps, sacrificed the old balloon and began to fill the new one. Our balloons are military surplus ones and we have to remove an extra skirt prior to flight. I now had to perform this in the field, something I'd never done before.

Now that filling was underway, I returned to rigging the payload line. As we were nearly full, Gus checked the lift with the ballast. As he released his grip, the balloon neck popped off the fill valve and balloon shot skyward. Thankfully our safety line caught it and we pulled it back down but not before losing even more Helium. Again we put more Helium back in and prepared to check the lift again. Now we realized that the ballast jug had been kicked over and we lost about 300 grams of water. Without accurate ballast, we estimated high and over filled a bit just to be safe. Gus pulled the stopper to close the balloon neck only to have the string pull out of the stopper, possibly leaving a hole for the Helium to leak out so we also manually sealed the neck.

Just as we were ready to launch Gus called the local airport tower and they told us we would have to wait for nearby traffic. If you recall, I had mentioned that the wind was picking up. After about 4 minutes we were cleared. As we release our launch line, the person holding the stationary end let go as well so now we had a rope in the rigging that we didn't need. Thankfully was still had control of the payload so we pulled it back just enough to pull the rope free. After a quick check with everyone I let go of the bottom package and the balloon finally lifted off. This was not the end of our misfortune.

Gord had spent months working on a payload stabilization system based on the UAV development module from Sparkfun Electronics. It uses a gyro to measure the rotation and moves a pair of airfoils to counteract the rotation. The airfoils were designed to break during landing or other impact during post-burst. What we hadn't anticipated was the force of the wind at liftoff combined with our generous 1100 fpm ascent rate. At about 100 feet, the first wing broke off and fluttered to the ground like and autumn leaf. The rest of the payload disappeared rapidly into the blue.

Both our VE5AA-11 and VE5AA-12 trackers seemed to be working flawlessly so we took a bit of time to watch some of the live ATV from the balloon. After a few minutes we hit the highway to rendezvous at the predicted landing site. Half way there, we were disappointed to see the VE5AA-11 beacon stop completely. Undeterred, we arrived and the rendezvous site and shared some Eccles cakes. I highly recommend them.

As the balloon descended we were stuck by our final piece of bad luck. Gord, who can usually spot the balloon or parachute at just about any altitude by merely glancing in its general direction was unable to spot anything despite scanning the skies with binoculars and a spotting scope.

Once the balloon landed, a short drive got us to within range of the beacon and we had a precise fix. We spotted it on the far shore of a small lake, no more than 200 metres from the edge of the water. We were very glad that our bad luck had finally run out. We drove around the end of the lake and walked about 500 metres to retrieve everything intact. In fact the second airfoil had survived everything and only broken off on impact, just as planned.

A bit more bad luck had already befallen us but we didn't know it until we inspected the SD cards from the cameras and found that the up looking video camera failed to record anything. The side looking one was a completely different story. It clearly showed that even one airfoil was able to easily control the spin of the payload. In fact it was so effective, it caused the spin to turn into an oscillation which caused the payload to repeatedly spin left then right about 10 degrees. It was clear that the concept would work very well as long as we could alter the micro code to dampen the reaction a bit. It worked up to 10,000 feet were a bug in my camera controller code switched the video camera to power saving mode.

Now, what in the world could have caused such a sting of horrible luck? Well, this is the first time that we forgot to put our mascot into the payload package. Our mascot is a small black plastic bull that adorns the neck of a Spanish red wine that VE5LEE and VE5BNC particularly enjoy. Did that really cause all of this? Are these little fellas so powerful that they can ward off the terrible things that can befall balloonatics? You'll have to decide for yourself.

Hi Tony,

A latex balloon bursts at roughly a predictable gage pressure (internal to ambient), regardless of ambient pressure. And I'd think that the low density of air at 90K' would ameliorate the intensity of the shock wave relative to lower altitudes. A number of folks have recorded real-time video of bursts, and it doesn't appear to have any "blast" impact on the parachute or any other part of the payload string. What does happen is that shards of latex are driven downward, often below the parachute skirt, and if they're allowed to reside until PBC develops at very high true airspeeds, 'chute fouling can ensue. Now, those who have recorded audio during burst have heard a pretty loud report, but not a deafening one.

You're correct about a persistent pursuit an altitude record. Quite often, the bulk of the payload string comprises student-built experiments which just expect to get into near space. Going for an altitude record, especially now that the ARHAB record is over 127K', requires maximum burst volume and minimum neck loading, i.e., a 3000 gm or larger latex and no more than a very light APRS beacon to register GPS elevation plus a minimal parachute, if any at all.

But, it's nice to become a record-holder from time to time :=), and there are quite a few classes of ARHAB records to go for.

Bill Brown has flown several latex "leakers", yielding some pretty long-duration flights. But that approach might get one upwards of 36 hours of flight time - once enough gas has vented and night falls, the balloon will inevitably descend to the deck before the next sunrise. The latex bags we use also deteriorate pretty rapidly in the intense UV at altitude. The ARHAB DX record use a plastic zero-pressure bag with controlled ballast dump to compensate for lift lost during overnight cooling.

Another group has fitted a latex with a controllable dump valve in the neck, which opens before the bag bursts and yields a near-constant descent rate to the deck, with the bag still erect on landing. The downside of landing with an intact balloon crops up if there's a good bit of surface wind, which can beat up the bottom of the payload string pretty severely, even to the extent that important bits break off, thus reducing neck load and allowing the balloon to ascend again. But if the landing site is a wide open space and winds are calm, recovery can be a real sweet experience.

Yes, cutting away before burst has been done, and it's a swell way to mitigate PBC by keeping the shard load off the 'chute apex. Some experiments may have upper limits on altitude, and from time to time, a weak fill or a leaker may make an early cutdown more desirable than hundreds of miles downrange to the recovery site. Another is to prevent landing in an undesirable site, like an airport, deep canyon or populated area.

BTW, >every< flight is an in situ experiment, and there's been some pretty fancy data collected. But the PBC dynamics are somewhat (understatement) complex - kinda like predicting the signal strength of a ZS6 station on 30m at your antenna feed point.

Hey, what's keeping you from diving into the balloonacy pool? The water's fine, and no one expects you to conduct a flawless flight out of the box. EOSS has over 150 flights under its belt, and almost one of them was actually perfect :=). Ma Nature and Murphy are pretty tough opponents. If it were routine, I'd take up a more exciting hobby, like stamp collecting.

BTW, I'm copying the GPSL reflector, which has a wider following than ANSR's Ballooning yahoo group.

EOSS uses a 50 lb FS antique brass spring scale to verify the
tare weight bag. And yeah, one need not have an eye on a meter.
We also double-check the fill by noting the tank pressure before and
during the fill. At constant temp, tank pressure drops linearly with
remaining gas volume.

See that is at what pressure tho? there for sure isn't the volume of the tank true?

And granted where we buy our H2 it's cheap,! we still can get a full bottle for like 15 bucks. but the exact amount is very wide variances of pressure when we hook up to it. so of course then the cubic footage is varying also. But at those prices I'm not complaining thats for sure.

Most flights we get almost two flights per tank. and sometimes we actually do get two flights if they are simple flights.

7417. Volume of gas in a cylinder

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-28 19:15:55 UTC
From: BASE
Topic: 7388 Message: 7417

Roger gave the industry standard values for the number of cubic feet in a filled cylinder. Here's where that comes from. Using the ideal gas law (PV = nRT), and recognizing that the temperature is essentially constant on the absolute temperature scales, the approximate number of cubic feet of gas that a tank holds is found by dividing the gauge pressure in pounds per square inch by the pressure of an atmosphere (14.7 psi) and multiplying by the volume.
For example, given that the T cylinder internal volume is about 1.76 cubic feet and the K cylinder is about 1.55 cubic feet, if the regulator reads 2400 psi on the T cylinder valve that corresponds to a pressure of 170 atmospheres. We can calculate that the volume of the gas at 1 atmosphere is approximately 290 cubic feet. When the regulator input pressure drops to 1470 psi, there would be 176 cubic feet of gas in the cylinder and hopefully 114 cubic feet of gas in the balloon.

Joe,

Just how wide a variation? **Numbers** please, ballpark numbers
if you have to.

Do you know what size when you say "full bottle?" By that,
I mean K or T size letter code, or cubic feet of tank itself,
not the cubic feet of compressed gas contained within.

Do you have any idea why your hydrogen so cheap compared to Zack's price at GPSL 2010?:

Hydrogen K Tank $42
A K-sized tank of hydrogen gas, including tax and environmental fee, delivered and
returned.

(Helium K Tank $80)

I sure wish you could sometime get a quote from your supplier
about a K tank of helium. That way it would be more of a
meaningful price comparison. Maybe you've got a gas supplier
with a heart of gold. :)

Hank

I think that the CGA standards require that tanks of a given size and gas
contain a precise number of standard cubic feet of gas. That means that
if the full tank temperature is below 20C, then the pressure will be lower,
and vice versa.

I stopped even looking anymore at the gauge when we first open the bottles. it's been years since we even thought about it at all.

I'll try to find out who supplies them with their gas. Where I get it from is NOT a "Gas" supplier. We were ripped off BIG time price wise when we went that route.

We get ours from a local farm supply store. that they have welding supplies. right next to the cattle prods and bull castrators etc. It's about 2 miles from my house and i just drive up and tell them I'm getting a tank and they open the door and we load it up.

No tank rentals. deposits, nothing, Matter of fact i have one tank i still need to take back, we just keep forgetting about it. it's been in my yard for over what 5 years? and they havent said a word about it.

-20 degrees Fahrenheit is 244 Kelvin150 degrees Fahrenheit is 339 Kelvin
The ratio of these temperatures is 1.39. The volume of the tank will be essentially constant making the pressure at 150 degrees Fahrenheit about 39% higher than at -20 degrees Fahrenheit. If the regulator pressure gauge read 2000 psi at -20 deg F it would read just under 2800 psi at 150 deg.

7425. Re: [GPSL] Digital hanging scale for checking free lift?

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-29 00:36:59 UTC
From: Mike Manes
Topic: 7388 Message: 7425

Using the ideal gas law, PV=nRT, for fixed V, n & R:

-20F is 244.3 Kelvin, and +150F is 338.7K. So if the tank reads
2400 PSI at 70F (294.3K), then it would read 2400 x (244.3/294.3)
= 1992 PSI, and at 150F, it'd be 2400 x (338.7/294.3) = 2762 PSI,
for a pressure difference of 770 PSI. Certainly noticeable!

Note that one must work T in absolute terms:
K=F-255.4 or K=C-273.2, thanks to wolframalpha.com :=).

> That could be the amount of swing we have noticed. going from a
> deep in the winter launch vs a hot summer day launch with the tank
> sitting out in the sun,,, could be!

Joe,

This is why I was asking for NUMBERS. It is possible to
give some answers to these things people observe, and debunk
mythology that sometimes develops, but usually only with
specific numbers. Some hams (not speaking about
balloonatics), despite their technical inclination, are
pretty capable of creating and propagating technical myths
and misconceptions which can become quite entrenched as the "conventional wisdom" and
difficult to take out of
circulation.

Case in point about the need for specifics is my question to
Bill on "Ballooning" yahoogroup about the balloon payload
line that he mentioned broke.

The anecdotes are fine, but the specific details, sometimes
requiring some numbers, are so much more meaningful,
instructive, and just plain useful.

Hank

7428. K or H or T, plus hydrogen pricing.

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-29 13:46:43 UTC
From: Mark Caviezel
Topic: 7428 Message: 7428

According to Linweld in Colorado, a
K of helium is 219 standard cubic feet, and
H of helium is 240 standard cubic feet, and
T of helium is 290 standard cubic feet.

I normally use T's, sometimes K's and only once ("ES-OS SIX") encountered an H.

Regarding the price of GH2, I have paid as little as $12 per a K cylinder, and as much as $50. Since there is normally not a posted price like gasoline at the pump, the gas companies often charge as much as they think they can.

best

Agreed on the pricing,

Like I said i went to "Regular" Gas companies. that all they do is supply tanks of Gasses. all sorts. and they always were the worst prices easily double others.

Then I found that farm store that carries welding supplies one day and asked them if they can get H2 and he says get? I already "Got" when i asked it was like the 15 bucks. and like I said no rentals, no deposits, nothing, just pay the 15 bucks and drive away with the tank.

As that 50's song said.

http://www.zazzle.com/gpsl_2010_shirt-235719242906244119

Shirts start at $17.45 each in qty 1 for a basic white T-shirt. Ordering your shirts as a group, even if you customize each one with a name or callsign, will reduce the price per shirt with quantity discounts and combined shipping. You can also get polo shirts if you don't want a T-shirt.

Please check over the design for errors - I'll fix them ASAP. Image from back of shirt attached.

Joe:
Sounds like you've got a real good deal with your farm store!
I am a little surprised a farm store would carry H2, not sure what the other customers would use it for; I've heard that the largest use was for Oxy/Hydrogen torch welding of aluminum which is far less common that oxy/acetylene torch welding of steel and other metals.
The last time I got hydrogen, it was five K cylinders. Which made the $50 per bottle charge (plus delivery charge, plus rental charges on the cylinder) seem like a gouge.

best

- Mark

Yeah the last time a local guy wanted to help out and he got a bottle
from a "National Chain" Gas supplier and by the time he was done with
all the costs it was $90 bucks.

Topic: 7433 Message: 7433

Perhaps I missed the discussion here..but here is another HAB flight TV 'news' story.

I suppose it's good to get the word about HABing out there to the general public but this guy makes makes it seem like he was the first to do this (in fairness to the guy that flew the balloon he wasn't asked particularly good questions either).

He sead in the interview they lost cell signal, here is the FCC ruling on the use of cellphone above the ground.

This can give all of us doing high altitude ballooning a blackeye.

Title 47: Telecommunication
PART 22—PUBLIC MOBILE SERVICES
Subpart H—Cellular Radiotelephone Service

Browse Previous | Browse Next

§ 22.925 Prohibition on airborne operation of cellular telephones.
Cellular telephones installed in or carried aboard airplanes, balloons or any other type of aircraft must not be operated while such aircraft are airborne (not touching the ground). When any aircraft leaves the ground, all cellular telephones on board that aircraft must be turned off. The following notice must be posted on or near each cellular telephone installed in any aircraft:
“The use of cellular telephones while this aircraft is airborne is prohibited by FCC rules, and the violation of this rule could result in suspension of service and/or a fine. The use of cellular telephones while this aircraft is on the ground is subject to FAA regulations.”

7439. Change in APRS call sign for BASE 44- now KB9ZNZ-6

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-30 01:13:02 UTC
From: BASE
Topic: 7439 Message: 7439

Dear friends,

BASE 44 is still a go for tomorrow morning. I have not be able to reprogram the MicroTrak 300.

We will fly under the call sign KB9ZNZ-6. I have changed the tracking links on the BASE homepage (www.depauw.edu/acad/physics/base). The id will say Taylor Balloon Sat HARP (but it is a BASE flight).

For those with good memories, the last time I ran under the KB9ZNZ call, the flight lasted 8 hours and landed in Lake Erie.

Sorry for the confusion, but I wanted to fly with some ability for the general amateur community to follow along.

From: Freddy W
Topic: 7440 Message: 7440

Is there a way to sent the images taken by the camera, like with an intervallometer every 15 sec or 30 sec., live captured on the grouns with a laptop ?
I guess you will be needing a 900Mhz radio transmitter and a Directional yagi antenna, but can it be done and so what is the technical equipment setup ?
The camera has an USB port that will plug in into ?? something else ?
Just wondering.

Freddy

Freddy,

I'm not sure if I'll have the time to wire things up by GPSL, but I will be running just such as system soon using a TV camera with serial output (the C328 - I think it's still available from SparkFun) hooked up to a Maxstream (9XTend) 900 MHz high speed radio module....the laptop on the ground decodes the serial stream and displays each still frame.

The alternative is to send down Slow Scan TV or Fast Scan ATV which several of us have used in the past. I'll be running live motion Fast Scan TV at GPSL this year.

Finaly somebody has the same idea as I have, I have been surfing the web for this now for days. My computer guy said that he will put something together but I think he does not exactly know what I'm talking about...
My first project was to put a camera in intervalmode like every 15s a picture and then download (wireless) that picture into my laptop, or a live capture video all the way up and hopefully down...
But I want to save all the images and Video !! So that might be a huge file.

Sir, I'm not a technician or electronic's guy but I know a few things
I hope the 900Mhz Radio modem or the Maxstream that you mentioned will be broadcasting a signal that requires no license (??) Somebody told me that you need a license for a certain frequency and Hawaii you have to deal with the FAA and the Military and prob. freq license and the Ocean......
Bill if you have detailled information on one of these options that workd please do let me know, I want to launch a balloon any time soon... But that might take a few months.

Thank you very much.
Freddy

7443. Huntsville Field Day balloon flight recap

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-30 06:26:09 UTC
From: wb8elk@aol.com
Topic: 7443 Message: 7443

I flew my multi-mode tracker on 144.34 MHz FM sending out DominoEX22 and 300 baud ASCII RTTY in celebration of Field Day.

We hitched a ride on the weekly ozonesonde from near UAH in Huntsville, AL at 1 pm last Saturday at the start of Field Day.

I earlier had told the Huntsville Amateur Radio Club that their Field Day site near Integraph in Madison was my target and I was going to try to land everything right smack dab in the middle of their location.

In order to keep things as lightweight as possible, I didn't put the amplifier section onto my tracker board and just attached a quarter wave wire whip (supported by soda straws) directly to the output of the synthesizer chip for a whopping 8 milliwatts of output power. Total weight including the built-in Inventek GPS, 4 AA lithium batteries, duct tape and three layers of bubble wrap insulation was 4.5 ounces.

I had two ground stations setup about 20 miles apart (as well as in my car) to receive the DominoEX and 300 baud ASCII RTTY telemetry and decoded it via a modified version of FLdigi (called dl-FLdigi) which sends checksum validated telemetry data directly to a server in the UK which plotted onto the http://spacenear.us/tracker Google map display.

Alan Sieg WB5RMG was able to visually see the balloon from his location at the Marshall Space Flight Center's Field Day site and actually watched it burst at 97,100 feet. Meanwhile at the Huntsville Amateur Radio Club's site we could see the parachute as it descended below 15,000 feet and a large group of those in attendance watched in fascination as it slowly drifted directly across their Field Day site to land just 0.75 miles east of us.

Someone on the GPSL list said I'd be the "King of Ballooning" if I could land it on our Field Day site...does 3/4 of a mile at least qualify me for the "Crowned Prince of Ballooning" ;-) . I'm getting closer each year....last year I told the Eva, AL Field Day site I'd land on them and missed them by one mile.

Shane N4XWC, Ethan Chew of the Makers Club, Barry N4MSJ and I could hear the signals as we drove down Zierdt Road along the west boundary of the Redstone Arsenal. We were surprised to see it all floating on top of the waters of Lady Ann Lake in the Edgewater subdivision about 200 feet from the nearest shore. Curiously enough this was only a few hundred feet away from where I landed the 2008 Field Day balloon two years ago inside the Arsenal.

As we approached the shoreline of the lake nearest to the payloads, we noticed a very conveniently located kayak lying inside a gazebo. We asked the homeowner if we could borrow his kayak and he gave us permission. Ethan Chew paddled out and successfully rescued everything in good shape. All payloads were still operating even after 30 minutes in the lake.

Although the 8 milliwatt signal from my transmitter was a real challenge to receive when directly below it's vertical whip in the "cone of silence" I did manage to get perfect copy

from my farmhouse remote base 20 miles away and never missed a transmission throughout the flight.

We brought it all back to the Huntsville Field Day site and had a nice show n tell during their cookout.

I'll probably update my website in the next day or two with some photos of the flight and kayak recovery.

- Bill WB8ELK

7444. Need some ideas

I received an eMail today from a guy on Oahu, HI that wants to launch a balloon. I did the math and it might just be possible see: <http://nearspaceventures.com/w3Baltrak/CurrMissionPlot.pl>. But lets face it he is more likely to lose the flight than anything. And he is OK with that, but he wants some ideas on how to get photos down from the launch before it goes swimming. And other ideas how to proceed. Seventy miles of island in the mid-Pacific, hell of an opportunity for Great Plainers. Any ideas? I bet a big island launch would be easier at least and with the winds they way they are maybe it'll land on one of the other islands. Cool!

What about a water recovery in a sealed and hydrophobic-vent-equipped styrofoam ice chest? Too bad the SPOT tracker doesn't work in Hawaii (my brother took mine on a trip there and it didn't work)... This'd be a great application for it.

He ought to considered a reefed parachute. That would allow this near space craft do drop faster and recover closer to the launch site. On a "typical" mission, the descent portion of the flight is about 1/3rd of the entire flight path.

He just needs to make sure the reefing system will open the 'chute before touchdown.

Note: Slowing down by parachute is called aerobraking. Slowing down by impact with the ground is called lithobraking.

7447. Re: [GPSL] Need some ideas

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-30 15:38:43 UTC
From: Pete Lilja
Topic: 7444 Message: 7447

There has been some recent discussion amongst some rocketry buddies of mine using an altimeter based line-cutter to un-reef a parachute. In rocketry we use an e-match and a very small pyro charge to deploy the 'chutes but something similar could be done without black powder by innovative HABists, I'm sure. Here is a link to the forum where this has been discussed recently: http://tqc.yuku.com/topic/3188?page=1 In my limited experience and opinion using a large parachute from burst altitude in a HAB flight is unneccesary. A small drogue to keep things stable until an altitude of, say, 1500' where the main 'chute opens would be sufficient for safe recovery of a HAB. That's the technique used in High Power Rocketry. I've seen many, many heavy rockets 50+ lbs. open their mains from 800 to 1200' and slow enough to avoid the dreaded and damaging "lithobraking."

And as far as those ice chests mentioned. I purchased for a few bucks several years ago a very similar box at the local fishing bait shop / store. It was sold as a wormbox. It's stood up well to 4 HAB flights as it is a much denser stryofoam that those cheap coolers from Wal-Mart or K-Mart.

I've sewn loops into the bottoms of parachutes to attach the shroud lines.
I was thinking that someday I'd like to lace a thin dacron cord through
these loops and tie a knot. The cord would prevent the 'chute from fully
opening. I've successfully used a coil of nichrome wire to melt the dacron
and figure it would be ideal for a reefing system. For redunacy, I'd use
two line burners on opposite sides of the 'chute with each one with its own
battery and microcontroller. The micro could be programmed to cut the time
based on either pressure, temperature, and time. That gives each micro a
triple redunacy in detecting when to cut the line.

I think a reefed chute deployed at low levels, combined with careful selection of launch dates and times based on the wind forecast, should result in at least the possibility of on-island recoveries. I haven't looked at the wind climatology to know how frequently that might occur.

Based on my recollection of Oahu's terrain (from my one two-day visit), and how much of the island is difficult or impossible to access, even an on-island landing does not guarantee recovery. It might be better to make a waterproof (but still vented) payload, plan a landing several miles offshore and arrange for a boat. At least you don't have to contend with trees, crevasses, or military installations.

As I recall, there was a ham in Puerto Rico who faced many of the same difficulties with his launches.

Thanks guys for your reaction...
I already bought a 900mhz broadcast modem for live viewing the images.
As far for recovery, I will use a parachute but as you said the ocean or even the terrain makes it almost impossible to recover.
I will try to get thing electronically worked out and I see from there. If not I will come to the mainland to try it out there.
It might take a few months but I will get there, still waiting on the FAA approval to launch a weather balloon here in Hawaii.

From: Freddy W
Topic: 7451 Message: 7451

I just bought a XT09-PKI-RDA 1 Watt/900 MHz stand-alone radio modem to add on my equipment list.
I just wonder what divice do you need to plug in into your laptop to get the signal from the 900 mhz modem ?
Sorry for this question..
Freddy

This looks like it is a RS-232 device instead of USB. You'll need a
RS-232 port on your laptop, or a USB-to-serial converter. You'll have
a data stream coming out that will look just like what went into the
radio at the other end.

I worked with a hot-air balloon pilot who bought a pair of these
radios for tracking a record attempt. Initially we were going to go
the APRS route but it wasn't suitable for his requirements. They work
pretty well, though you may need a handheld beam to receive the signal
at longer distances.

Keep in mind that the 9600-baud mode will not keep up with a full-time
9600-baud input data stream. There is some overhead in the RF
encoding and the effective data throughput is less. We found this out
the hard way.

Thanks,
I will use a USB-to-Serial converter and the software I have from my telescopes controls....
I also planning to get a directional yagi antenna for better signal.
Somebody used it before and it seems to work they said.
Now what do I need for capturing on the ground with the laptop ?
Software, hardware ? Are there any pictures on this ?

I hate to say this but maybe you should have a water landing planned. A tightly sealed container that floats. If it lands upright you could place a beacon on it (and the group can determine what would best propagate over a water path). When everything is done correctly you can determine within a few miles of where the package will land and you could have a boat already in the area of drop that has the ability to track. As long as there are no storms kicking up the waters the swells should be manageable.

It would be an area that has not been fully investigated yet. If Apollo and Mercury space missions can have water landings, so can you.

I agree with Mark. If I was there I would insist we do have a water based landing and just design the payload accordingly. Float like Buoy, with the transmitting antenna as high as possible to transmit out as far as possible.
> A tightly sealed container that floats. If it lands upright you could

I would think myself even 2 meter should go for several miles. I would think something like the old Micro trac 300 bobbing on the ocean would have a better chance of being heard than it would here in wisconsin in a valley. surrounded by 300 foot tall hills.

Well i wouldn't go that far. Apollo and Mercury, Gemini too, all were the government, and that have permission to launch giant rockets wherever they want do we?

Freddy:

If you need assistance maybe I could bend the ear of a few hams I know there on Ohau and see if one or more would have access to a boat.

Topic: 7444 Message: 7458

That would be great !!
That gives me hope.
I will adjust my plans like wise !!
But it will take a few months, hope to get it all ready sooner.
Freddy

From: Jerry Gable
Topic: 7451 Message: 7460

All you really need is 2 of those radio modems. Out of the box they work as a serial line replacement. What you send on one comes out the others serial port.

I use them for telemetry data on my balloons. For the ground station I put one in a small box with a serial to USB converter and 5V regulator. I hook that to my PC to receive the data.

I have a couple of circularly polarized patch antennas that I use. They are actually RFID antennas. Some of the Hams can probably give you a lot better advice on the antenna choices. I am interested in that topic as well.

Thanks,
I will use a USB-to-Serial converter and the software I have from my telescopes controls....
I also planning to get a directional yagi antenna for better signal.
Somebody used it before and it seems to work they said.
Now what do I need for capturing on the ground with the laptop ?
Software, hardware ? Are there any pictures on this ?

Freddy

7461. Re: [GPSL] Re: Need some ideas

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-30 20:31:58 UTC
From: Michael Willett
Topic: 7444 Message: 7461

There is a bit of a challenge, the package must be able to breathe air out and in for the ascent and descent and then must be water proof and self-righting in the water with possibly parachute and shards of balloon attached.

My initial thought would be a ball-like enclosure (Styrofoam ball) top weighted with batteries and goods, with the 1/4 wave whip sticking out of the bottom. The 1/4 whip antenna would be downward pointing for ascent and descent, and then upon contact with the water would self-right with the drag chute and balloon shards in the water, with the 1/4 whip now pointing up for best propagation.

I would like to vote that GPSL be in the HI islands for 2011! :) This - uh - "pre-planned" water landing stuff sounds like great fun!

There is a Space Grant Consortium operation in Puerto Rico. I'd definitely get in touch with them. They have done flight from their hunk of terra firma and made lots of recoveries:

http://www.prsgc.upr.edu/

Good luck.

Pete Sias showed our Manhattan club how he machined an enclosure from Styrofoam. You could glue sheets together and then spin it up on a drill press. It shapes with a sheet of sandpaper. I've made a hemisphere using this method. I completed it by covering it in 1/2 oz. fiberglass.

So I need two of these modems ? One in the balloon and one that goes into the serial (USB) of my laptop, pleade do confirn this.
Do I nee a license for that when I use then ?
Maybe I can get the Oahu Ham guy involved and use his license.
Just to get legal ..

Go to the address below for perfect spheres.

Tell them Joe from Near Space Sciences sent ya.
This is a ball we used once, it's 16" diameter and has 7/8" thick walls.

Its nice locking tabs so when the halves are places together they line
up correctly, really cool.

7466. BASE 44 completed

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-30 20:51:19 UTC
From: BASE
Topic: 7466 Message: 7466

Dear friends,

Our flight today pales in comparison to the excitement on the list about the Hawaii flight, however, I want to report a complete success.

Launch was a few minutes early, and the ascent was slower than planned since the slight breeze gave false lift. Both of these factors aided the flight in landing in a favorable (i.e, no trees) environment. We watched the ascent from 60 kft till burst at 84 kft from the square in Hope, Indiana. Final descent was observed from about 5 kft ASL. Landed in soybeans about 100 yards from the road and closer to a corn field. No property owner was located, although I made friends with a pair of elderly dogs.

Lunch at the Hope Market post-flight was nice (and reasonably priced), if you're ever nearby :).

I was pleased that the 600 gram balloon with a Helium fill made it to 84 kft.

Hope to return toward Hope again sometime soon (maybe next week).

Thanks for your support,
Howard

I've been flying the OEM version of these radios for years - first with Taylor's HARP team and now on my own, and they work great. They work in the ISM license free band, so you don't need a callsign unless you're planning on adding an APRS beacon (makes for a good backup, and the rest of us can watch online while you're in range of an iGate). Keep in mind that they have two over-the-air data rates (the speed at which the RF is transmitted... a different number than the interface rate, wich is the speed at which the hardware lines run), and the choice you make on 9.6k vs. 115k has an impact on the functional signal-to-noise ratio. In other words, you'll wind up with a shorter range on the radios at the higher over-the-air rate given the same antennas, operating conditions, etc. A link budget will help you decide on an RF configuration... here's an easy calculator: http :// www . aubraux .com/design/rf-link-budget-calculator. php . Other calculators with much deeper insight can be found with some Googleing .

Good luck!

-David

For the Digi radios, you will need two, one on the balloon and one
with the ground station computer. This simply replaces the 20-mile
serial cable with an RF link. No license for the Digi radios
necessary.

Freddy,

Yes, you need two of them and they are license-free...the nice thing is that they are bidirectional, so you can actually send commands up to your balloon....in fact you could send a cutdown command to keep your balloon on land by cutting down at a lower altitude. I have used these radios on both balloons and UAV's....I actually was able to fly the UAV using this radio to control the servos (and received telemetry back from it as well)and could fly my UAV from the laptop just like I was in the cockpit.

As was mentioned in a previous email....it says 9600 baud RF rate....you won't get that in practice for actual serial communications due to communications overhead.....so plan on sending it data at 4800 baud or slower for best results.

There is a mode that is much higher RF data rates but the range is greatly reduced in that high speed mode.

And yes, they use RS-232 serial data and requires a USB to RS-232 serial adaptor for modern laptops.

With judicious use of online Balloon Track, you can predict with a fair degree of accuracy where you'd need to launch from to keep your balloon on land....Summer is the best time to keep things in close. Our flight last weekend stayed within 4 miles of the launchsite. In the Winter, it can drift 200 miles downrange.

So I need two of these modems ? One in the balloon and one that goes into the serial (USB) of my laptop, pleade do confirn this.
Do I nee a license for that when I use then ?
Maybe I can get the Oahu Ham guy involved and use his license.
Just to get legal ..

7472. Kaymont 600 gram balloons on eBay

Yahoo group: GPSL (2009 — 2010)
Date: 2010-06-30 21:25:04 UTC
From: wb8elk@aol.com
Topic: 7472 Message: 7472

I noticed that Howard at BASE mentioned that his 600 gram balloon made it to 83,000 feet. I flew one I bought on eBay for $20 that had 9.5 pounds of nozzle lift and made it to 93,000 feet. The ones I got from eBay were just one year old and packaged very nicely. I see that the same fellow is on there still selling them for $20 each for those interested.

Freddy,

I've also been flying these for years.....started out using them on remote R/C planes and remote vehicles.

You can achieve maximum range with these by picking out a good small yagi gain antenna for the ground station or vehicle and choosing a good vertical duck for the balloon. However, I get the best results by using the Little Wheel design for 900 MHz (an omni horizontally polarized antenna that has no null points underneath the balloon). You can buy these from PC Electronics, the 900 MHz version is called the Nano Wheel.
http://www.hamtv.com/oal.html

If you go this route, make sure to mount your ground antenna so that the elements are horizontal (same plane as the ground). If you can keep up with the balloon, then a patch antenna on your car roof may work as well.

As mentioned by David.....choosing the higher speed radio link of 115k baud will cut down on your maximum range dramatically.

Also, you'll save yourself some grief by buying the SparkFun breakout adapter board that brings out the dual-spaced 2mm pin spacing to a single row of 0.1 inch header pins for easier wiring. Remember to operate these at 5 volts unless the development board comes with it. Keep in mind that it can draw 730 mA on transmit.

Thanks Mark,
they are on Ebay now.. So I get another one.

You need 2 of them. These operate on an unlicensed band so you do not need a license.

Also....remember to get the XT09 version....series that's called the 9Xtend.

Freddy...do you have the link to the eBay auction where you bought this device? The X09 series is only 100 milliwatt output power....you need the XT09 series which puts out a watt.

This is the item I would've ordered on eBay that already has the interface board (they mislabeled it as X09 in the title) that includes a 5 volt voltage regulator and brings out the RS-232 serial data lines....they have a few more and it's a good deal since the module by itself without the interface board is usually $180.

http://cgi.ebay.com/MaxStream-X09-900-MHz-Data-Radio-Modem-/260570121060?cmd=ViewItem&pt=PCC_Modems&hash=item3cab308364

Freddy....use the online Balloon Track prediction program at: www.nearspaceventures.com use 1000 feet/min ascent and 1100 feet/minute descent. Much more accurate than the UWYO program that the MIT folks have in their "Guide".

What town and island are your nearest to?

Thanks guys for all your support.
The FAA just got in touch, I need to call them back for more details,
I just did a 'Balloon Trajectory forecast' again and it lands in the ocean... again, so I will concentrate on this landing plan for now.

Freddy

Hi Bill here the link:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=260575456925&ssPageName=STRK:MEWNX:IT
It seems to be the XT09 - 1Watt, so I hope they are good. Made an offer for $180.
The picture in your post was indeed misleading, I was planning to bit on those.
Hope I made the right choise.
Freddy

7480. hawaii high altitude balloon ideas

Yahoo group: GPSL (2009 — 2010)

From: Mark Caviezel
Topic: 7480 Message: 7480

Freddy,
First off, welcome to this list. Many of us on here have been doing this for 10-20 years. But seems like there are more newcomers in the past year than in the past ten years.

Secondly, I will recommend consideration of getting a tech ham license. It is NOT a huge hassle. If you are technically minded, there is a good chance you could pass without even studying. (I did!) General and Extra class licenses are an entirely different matter, but a technician license gives you radio privileges that will really help you operate unmanned balloons.

Thirdly, you should know about something called stratospheric turn around. In the summer, the stratosphere above about 60k feet blows from the east to the west. You could use this to your advantage: launch a balloon with the intention of landing west of the island. Then rely on surface winds (I am presuming they are from the west, really don't know) to blow your payload on to the western shore. Your payload should obviously float and should incorporate a 'sail' feature as well as an antenna for your APRS beacon. Once you learn more about APRS you will likely really want to get your ham license so you can use the system.

A recent flight
http://aprs.fi/?call=N1VG-11&mt=p&z=8&timerange=86400
conducted in southern California clearly shows an active 'turn around' above 64,000 feet. You'll likely want to become proficient at running Bal-Trak or the other balloon trajectory prediction software packages.

There are a number of really cool techniques that could be attempted to enable recovery. Good luck!

best

- Mark ng0x

Here is a question.

I never checked into it. ok here in the midwest USA the tropo winds usualy go from the west to the east, and like mark says in the summer the stratosphere has winds that go in the oppisite way. East to west.

What is it like in like the KP4 guys where the tropo winds are east to west mostly. what does the stratosphere do?

From: Mike Manes
Topic: 7444 Message: 7482

Hi Keith,

The U of Puerto Rico space grant guys have mastered the maritime recovery.
They wrap each payload in a garbage bag and seal it with duct tape, IIRC
from Ocsar KP4RF's description, and they have a power boat with APRS ready to
launch when the balloon launches. I've cc'ed him on this reply, and I'm sure
Oscar'll happy to give Freddy some tips.

BTW, Freddy should consider getting his tech ham license so he can fly some
decent tracking beacons - it's a WHOLE lot simpler and cheaper to recover the
payloads and SD cards to fly again than it is to try to wring out some decent
images using Part 15 gear. Or to fly ATV with some power in the ham bands.

> I received an eMail today from a guy on Oahu, HI that wants to launch a balloon. I did the math and it might just be possible see:<http://nearspaceventures.com/w3Baltrak/CurrMissionPlot.pl>. But lets face it he is more likely to lose the flight than anything. And he is OK with that, but he wants some ideas on how to get photos down from the launch before it goes swimming. And other ideas how to proceed. Seventy miles of island in the mid-Pacific, hell of an opportunity for Great Plainers. Any ideas? I bet a big island launch would be easier at least and with the winds they way they are maybe it'll land on one of the other islands. Cool!

A hydrophobic material like Gore-Tex would work great as a vent. Not much flow rate is needed, as the volume has so much time over which to equalize pressure.

A Tyvek membrane can breathe air (slowly) but is impermeable to liquid water.
This is the stuff that those slick-feeling mail envelopes that need a knife
to open are made of.

There you go. A piece of parachute fabric (or something similar) with
Scotch Guard applied to it would probably also work well.

Thanks Marc for the welcome.
I will look into that license.
And you're right about that stratospheric turn around at around 60.000 feet, I make the balloon trajectory calculation most every day now and you can see it very clearly in each projected forecast, I might be lucky.
Right now I will follow up every post and link to get as much information as need.
Thanks Guys.

Freddy

>
> Secondly, I will recommend consideration of getting a tech ham license. It is NOT a huge hassle. If you are technically minded, there is a good chance you could pass without even studying. (I did!) General and Extra class licenses are an entirely different matter, but a technician license gives you radio privileges that will really help you operate unmanned balloons.
>
> Thirdly, you should know about something called stratospheric turn around. In the summer, the stratosphere above about 60k feet blows from the east to the west. You could use this to your advantage: launch a balloon with the intention of landing west of the island. Then rely on surface winds (I am presuming they are from the west, really don't know) to blow your payload on to the western shore. Your payload should obviously float and should incorporate a 'sail' feature as well as an antenna for your APRS beacon. Once you learn more about APRS you will likely really want to get your ham license so you can use the system.

Hi Freddy,

That eBay link you sent me is indeed the correct XT09 unit that puts out one watt so you'll be ok with that one.

Hi Bill here the link:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=260575456925&ssPageName=STRK:MEWNX:IT
It seems to be the XT09 - 1Watt, so I hope they are good. Made an offer for $180.
The picture in your post was indeed misleading, I was planning to bit on those.
Hope I made the right choise.
Freddy

Hi Bill,
That a relief Bill, I bought two for $200 each, (offer).
I'm going thru a lot of websites to get all the information I need and more, I'm making a planning step by step to get things right.
The original plan was much simpler...

I use the software to make traject predictions, do it a few times a day and compare that with the google predictions from another software, they are close.. But you cam make more input in the nearspaceventures one.

7490. coupon code for GPSL shirt orders

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-01 16:03:33 UTC
From: Mark Conner
Topic: 7490 Message: 7490

From a Zazzle promotional e-mail received earlier today - expires July 5.

73 de Mark N9XTN

* 17.76% of the net sale price will be deducted when the coupon code ZAZZLEUSAUSA is applied at checkout. For most products, the net sale price is the price of the product (excluding shipping and taxes). For Zazzle Custom Stamps, the net sale price is the difference between the price of the Zazzle Custom Stamps (excluding shipping and taxes) and the face value of the postage. Offer is valid from July 1, 2010 through July 5, 2010 at 11:59pm PDT. This offer does not apply to past purchases and may not be combined with any other Zazzle promotional or volume discount offers. If a volume discount applies to your order, you will receive either the discount set forth in this offer or the standard volume discount, whichever is greater. Offer valid on Zazzle.com only.

7491. Balloon Project Hawaii

Yahoo group: GPSL (2009 — 2010)

From: Freddy W
Topic: 7491 Message: 7491

Still waiting from some word of the FAA,
Also updating my Balloon project every day and goin thru a lot of websites to find the proper information.
Need to find some answers for:

1) Proper devices for Balloon inflatiob or does it come with the Helium tank rental ?

2) Also software that need to be installed in the laptop to capture the images coming from the balloons transmitter.

3)What is the proper way to attach the parachute to the balloon ?

4)Even if th balloon is not all the way inflated, what is the max ceiling hight ?

5)Proper antenna for capturing the signal at 100.000 feet.

6)In Hawaii there will be 5% change to recover the Balloon, lots of mountain ranges, Ocean an unaccesable terrain and you might get shot.

Hope to find all these answer.

Freddy

You will probably need to make yourself a balloon filler, usually a hose with fittings to connect either to a regulator or directly to the tank and PVC with hook to hold either weights for lift or a hanging scale.

2) Also software that need to be installed in the laptop to capture the images coming from the balloons transmitter.

3)What is the proper way to attach the parachute to the balloon ?
Most attach it in the train about 20 feet or more lead from the balloon. You do not want the balloon to become entangled in the parachute. Others will comment.

4)Even if th balloon is not all the way inflated, what is the max ceiling hight ?
Depends. Chances are good that you would not stay true to your track as you would not lift at the proper altitude and it would lengthen out the flight. You could also create a floater that does not climb up enough to pop when needed. It could come down either in darkness or take several hours for UV to work on the balloon and let it pop.

5)Proper antenna for capturing the signal at 100.000 feet.

6)In Hawaii there will be 5% change to recover the Balloon, lots of mountain ranges, Ocean an unaccesable terrain and you might get shot.

Hi Freddy,

Re ur #4) Download a copy of LiftWin 041 from:

http://www.eoss.org/dnload/liftw-041.zip

It's a simple and very useful tool for calculating your fill
and burst altitude given a chosen balloon, neck load and launch
site conditions. I'd recommend filling for at least1000 fpm to avoid
a floater or more if you want to keep your downrange distance shorter
at the expense of lower burst altitude.

7495. Winona Minnesota Field Day Balloon Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-02 15:00:42 UTC
From: Joe
Topic: 7495 Message: 7495

Morning Kyle,

I'm copying this message also to one of the most active balloon lists out there.

Forgive me if you already know all about this. There are soo many ballooning groups out there now it's hard to keep track of them all anymore as to compared to when this all started over 20 years ago when there was only maybe six groups.

If you are fully aware of these lists or the other groups I apologize. I also have been thought of as being a newbie even tho I have been doing this for over 20 years.

I have thought of several times, but just never done it was to fly a cluster balloon setup like you did here. Thinking fill them all equally, or even fill one main balloon to be neutral buoyant. and then add one smaller one that will provide the positive lift needed to climb. And size the two balloons so that for sure the smaller one pops first, then causing the whole system to become neutral.

I just never tried either way. but what you have done below did just that and pretty cool dude!

You should submit this to the record keeper for a pretty good distance flight! For the rest of the gang here is a video Kyle made of his launch

http://www.youtube.com/watch?v=I4GwirAR3_E&

and below is a message he just sent out describing what happened. Pretty cool dude!

and Again Congratz! on the long distance flight!

7496. OT: Power Output of a Yeasu VX-2

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-02 19:43:52 UTC
From: Pete Lilja
Topic: 7496 Message: 7496

I just received a used Yeasu VX-2 HT and cannot find in the documentation what the UHF "low" power output wattage is. It lists the "High" setting as up to 1.5 w with the supplied battery but not the low end output.

I suppose most people are concerned about the max power - yet I know from experience that .5 (1/2) watt through our roll-up J-pole is very adequate for HAB flights and that's how I plan to use this VX-2.

Can anyone help? Is anyone else using a VX-xx in their HAB flights?

*TRANSMITTER * 0
RF Power Output:
1.5W (@ 3.7 V FNB-82LI 144 MHz)
0
3.0W (@ 6 V EXT DC Input 144 MHz)
0
1.0W (@ 3.7 V FNB-82LI 430 MHz)
0
2.0W (@ 6 V EXT DC Input 430 MHz)
Modulation Type:
Variable Reactance
Maximum Deviation:
±5 kHz
Spurious Emission:
At least 50 dB below carrier
Microphone Impedance:
2 k Ohm

This is higher than I remember it, but I often get the specs confused with the VX-1R which I also own. I think the VX-1R is 350 or 500 mW. In any case, it works fine with a rubber duck as an APRS beacon.

Pete,

The RF out for the FNB82-LI is listed on page 75 (Specs page) of the manual.

Here's a link to the entire VX-2R manual.<http://www.yaesu.com/indexVS.cfm?cmd=DisplayProducts&ProdCatID=111&ProdID=870&DivisionID>

If the hyperlink doesn't work, here's the URL

http://www.yaesu.com/indexVS.cfm?cmd=DisplayProducts&ProdCatID=111&ProdID=870&DivisionID

Sorry, cranial flatulence. I was thinking "low power" as "internal battery"
instead of "menu setting".

From: Freddy W
Topic: 7491 Message: 7506

So far no word of the FAA.
After reading the book of Paul Verhage (seems a dutch name)a great one BTW, there seems ro be no Class G airspace in Hawaii, So that makes it impossible to fly a weather balloon (?)
It took a while before I knew that, most flight school are closed here so I asked a pilot and he filled me in on this.
The FAA sents me from A to B and back. I guess they do not know either, or maybe brain failure what is most common in Hawaii.

The terrain of the land makes it hard to recover the payload anyway, to much military obstacles and mountains and unaccesable terrain here, even a water landing is difficult to recover due to the high and dangerous surf on the West and North shores.
So I might give up my dream and sell all my stuff and come to the mainland to watch and be part of a balloon chase one day, or I might fly the balloon here and nobody will ever know anyway..

Kinda disappointed now....

Freddy

Hi Freddy,

Class G airspace is quite rare, and it's NOT a requirement to limit your flight there. After all, if you ascend over 18,000 ft MSL in the National Air Space (NAS), you're automatically into Class A airspace!

Go back and re-read the FAR-101 link that I sent you earlier. For an exempt flight, you just have to avoid launching within 3 mi of an airport or into restricted or prohibited airspace. Pick up a copy of the FAA Sectional chart that includes your launch site and trajectory to see all the airspace classifications. They're available at the pilot shop at any controlled general aviation airport. You could even launch from an airport if you notify the tower and get an OK.

It looks as though a launch from the N end of Oahu would stay pretty
clear of low-altitude headaches, assuming an easterly trajectory.

From: Freddy W
Topic: 7491 Message: 7510

Thanks Guys for the updates,
Will continue my project as planned, just a few parts to come in and then put everything together.
Freddy

I'm seeing N9XTN-11 and KD4STH-8 tracking north from western Omaha at about 10k.

W0ZC-11 should also be on board, but transmitting more sporadically. It's possible that there was a problem and it was cut from the chain.

7513. BASE 45 on 6 July

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-05 23:14:08 UTC
From: BASE
Topic: 7513 Message: 7513

Dear friends,

BASE 45 is scheduled for tomorrow. Launch will occur from the roof of the Julian Science Center on the DePauw campus (39.64 N, 86.86 W). It is anticipated that launch will be before the scheduled 10 AM EDT (1400 UTC). Hopefully, we will be in the air closer to 9 AM EDT (1300 UTC).

The blocking high pressure with gentle surface winds from the south are leading to a flight that will head generally north. If the 600 gram balloon makes it to 85 kft with a nozzle lift of 9 pounds and a 5.75 pound payload, the landing may be directly north of the launch site about 35 miles away (or just north of Crawfordsville).

The APRS radio will be on 144.39 MHz using the W9YJ-11 call sign and no path for the beacon every two minutes. Principle payload will be the energy sensitive geiger counters.

Thanks for your support,
Howard

Attachments: 1 described; binary payloads are missing from this source WARC

yeah we learned that the hard way a couple years ago.

We have flown ATV with really old ancient GPS systems and it worked perfectly. but the GPS system was when gps systems were just coming out and were gigantic! the GPS alone had the antenna similar to they are now, the GPS receiver on the other hand was a 4 board levels of components on both sides, and measured 4 by 8 inches in size! And that was just the GPS! You still had to add like a KPC-3 and a HT transmitter.! the "Tracker" itself weighed on pounds!

BUT!! it was impervious to ATV. we flew that setup on a dozen or more ATV flights and worked flawlessly!

Then we "UP-Graded to like a garmin hockey puck, and thought how cool the whole tracker is in the ounces now. and worked great on all the radio audio experiments we did, probably 6 or so, before we did another ATV flight. Thinking like wow works great! bzzzzzzt! wrong.

We fired up the payload without the ATV running, (major power drain) and of course the GPS would up date from test location (My home) to launch site, so we thought cool GPS is working coredtly, then we'd be ready for liftfff and would turn on the ATV and release!

well the GPS from that point on sent the last valid position. the launch site sitting on the ground.

The GPS never locked on again throughought the whole flight.

The team at Sparkfun have lost their HAB , and are working on a tutorial set to document what they learned... the hard way. Currently featured on the Sparkfun front page, at: http :// www . sparkfun .com . The details are still a little sparse, but it could be a good read as details emerge, and perhaps an opportunity to help out one of the coolest hobby electronics shops out there.

Nice! You're making it harder and harder for me to miss the fun this year. BTW, this just showed up on the site in reply to one of my comments (it's from Dave Stillman, a SFE engineer):

Hey Dave! I talked with Rick from EOSS before launching, and he was extremely helpful and had tons of information. It's easy to see that they've been at it a long time!

I'm really bummed but I've got other plans during GPSL 2010 already, but I'm definitely going next year!

7522. BASE 45 completed

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-06 20:00:19 UTC
From: BASE
Topic: 7522 Message: 7522

Dear friends,

Today's flight was successfully completed. Launch occurred shortly after 9 am from the roof of our science building. I watched the balloon burst at 86,500 feet from a parking lot near US 231 and SR 32 in Crawfordsville. The system landed in eight foot tall corn at 40 degrees 8 minutes north and 86 degrees 56 minutes west. (According to my students, it was only 86 rows deep in the corn, that was fully tassled.)

Still hope to fly once more before GPSL. Look forward to seeing everyone that can make it to Hutchinson.

The no path digi on the 144.39 MHz every two minutes appears to have minimized our impact on the APRS infrastructure.

Thanks for your support,
Howard

Hey, Zack,

I assume you mean you'll be in Boulder CO this Thur? If so, then
stick around and join us in Deer Trail CO 0700 Sat 7/10 for EOSS-153
carrying 12 CU balloonsats if you can. That's 50 mi E of Denver on
I-70.

I'd love to, but at this point, I'm planning on hiking Mt Democrat on
Saturday morning.

Do you by chance have anything planned between Aug 7-15?

Bummer. If you bring an HT, listen up on the 448.450 / 100 Hz Pikes
Peak repeater for our T&R net. APRS on 144.34 and DF on 147.555.

Enjoy your hike, and hope you get back down before the afternoon
thunderbumpers hit.

Only EOSS event 8/7-15 is our meeting in SE Denver 'burbs on Tues 8/10.
You'd be more than welcome to join us!

Hi David,

Hey, I've used SparkFun stuff in some EOSS payloads, most recently the
SamCam II:

http://www.eoss.org/hardware/samcam2/index.htm

It uses one of your gear motors, a PICAXE-8, a rubber-tired wheel,
Nd magnets and reed switches.

I really appreciate having an outfit like yours in the local area.

BTW, if you'd like to learn how EOSS has earned its 100% recovery rate out
of 152 flights to date, come on out to one of our flights:

http://www.eoss.org/flight/

We're flying EOSS-153 out of Greater Downtown Deer Trail (school grounds)
this Sat 7/10 at 0700 MDST.

I've never seen an explicit list of classes that they will "permit" you to fly through, so long as you adhere to the basic "exemption" requirements (like having a 50lbs weak link between the balloon and the payload.)

Most flights I would guess end up through or at least nearby most of the airspace classes.

Hi Ron,

Despite it being OK per FAR-101, I'd think it'd be a great idea to stay out of those heavily-trafficked airspaces. As a minimum, keep in touch with the tower to get a launch OK. Note that the new NAS classification scheme post-dates the latest revision to FAR-101.

Actually, those 3 classes of controlled air space are pretty easy to
avoid, unless you want to launch from your back yard just a few miles
from one of those airports.

And don't confuse 50 lb "impact strenth" with tensile strength - apples
and oranges. Some folks who've used 50 lb tensile line have seen their
balloons soar skyward, unburdened by any payloads. We use 250 lb woven
nylon, and it'll certainly break if it's hit by an aeroplane going 100+ MPH.

Yup, you busted right thru Class B ... and don't think the FAA didn't
make note of it! We scrub or move launch sites if we think we'll even
brush close to DIA's Class B.

7535. Embroidered ANSR sport caps

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-07 00:47:05 UTC
From: compassing
Topic: 7535 Message: 7535
Attachments: 2 described; binary payloads are missing from this source WARC

ANSR people,

I have received ANSR Board of Directors approval to proceed with the purchase of a limited quantity of ANSR logo'd sport cap. Some of you have already ordered. Again, thank you for your support. To everyone else receiving this, you may now put your desired quantity on reserve.

We are able to obtain a portion of our order, *but only for those donors who get in on this initial order*, personalized at no additional charge. Limit is one line of up to eight alpha-numeric characters. Unfortunately circumstances beyond my control make it necessary that all donors desiring their name or call sign embroidered on the cap must get their reservation in right away. Time is of the essence. For ANSR to take delivery and have them available for potential donors attending the Williams' Ham Fest, we must receive your firm reservation by close of business day Thursday 07-08-10. If you do not want to trust the email servers for timeliness, *in addition to your written *email reservation, call or text 480-577-0612 to confirm you are on the donors reservation list before the deadline.

I took a photo of the completed sample cap which didn't turn out too good. That cap looks much better than the picture. The current version has enhanced contrast and a bolder, more golden color text "Supporting NASA space grants since 2001". They also compensated for "pull effect", stitch error, etc. These measures have greatly increased the precision, light refraction, iridescence, and overall appearance of the entire graphic. Again, the picture doesn't reflect these enhancements. You can take my word for it, this is fine looking cap you will be proud to wear, display or give as a gift or award. FlexFit is our cap of choice, two sizes fit all (S-M and L-XL), very high quality, 63% Polyester, 34% Cotton, 3% Spandex, is medium gray color with charcoal sandwich brim. From the rear it appears to be a fitted cap (no adjustment strap or opening). Gold text color was chosen for a good contrast with gray background material -- in memory of Michael Gray KD7LMO-SK. I will attach the picture and one of the graphic files. Donation level for the cap is $20. Please specify quantity, size of each cap, either S-M or L-XL and personalization text (up to 8 char.).

If you would like more info or have specific questions, let me know. If you want some of these with custom personalizations on any of the remaining panels, our vendor is offering ANSR donors a minimum of 50% off their already low embroidery charge. For instance, you could add Michael's call sign or "Michigan" his favorite sport venue or just be creative. A friend suggested, "Flew it to the edge of space and all I got is this hat!". Then there's the all-time favorite, " <--- I'm with Stupid!". Our vendor has been excellent to work with. If you prefer to place an order later, and if the ANSR board votes to repeat this offer in the future, and if (that's a

lot of if's) you decide to take advantage of our vendors generous discount, then you'll be pleased with their professionalism. In most cases, you can drop by, or better still, call for an appointment and they will embroider your order while you wait.

As an ANSR donor you can add anything alpha-numeric, any color, any size up to 2.25 inches tall, multiple lines or a full wrap around edge to edge of the ANSR/sphere graphic can be added for less than half of the normal charge. If we request additional personalization on the caps before they start production, ANSR will pass that cost, as well as your postage or shipping cost, on to you without any markup. The vendor may add a small handling charge to ship large orders. Their location, mailing address and contact info is included with each cap.

Caps will be available at the Williams' Ham Fest and the next regular ANSR meeting Monday 07-19-10, 1930 hours, ASU Tempe Campus, Orange Mall, Moeur Bldg. Watch these:
www.ansr.org <http://ansr.org/> or
http://groups.yahoo.com/group/Ballooning/
sites for meeting notices and talk-in details.

Best regards,
James, AC7ZT
Arizona Near Space Research
An Arizona non-profit 501(c)(3) organization
Promoting science, technologies and education (STEM; NASA) by exploring frontiers in amateur radio and high altitude ballooning.

PS. If you know the address of someone who has supported, or would like to support ANSR endeavors, please feel free to forward this to them.
Cross-posting to other enthusiats use-net and remailers is encouraged.

ANSR people,

I have received ANSR Board of Directors approval to proceed with the purchase of a limited quantity of ANSR logo'd sport cap. Some of you have already ordered. Again, thank you for your support. To everyone else receiving this, you may now put your desired quantity on reserve.

We are able to obtain a portion of our order, *but only for those donors who get in on this initial order*, personalized at no additional charge. Limit is one line of up to eight alpha-numeric characters. Unfortunately circumstances beyond my control make it necessary that all donors desiring their name or call sign embroidered on the cap must get their reservation in right away. Time is of the essence. For ANSR to take delivery and have them available for potential donors attending the Williams' Ham Fest, we must receive your firm reservation by close of business day Thursday 07-08-10. If you do not want to trust the email servers for timeliness, *in addition to your written *email reservation, call or text 480-577-0612 to confirm you are on the donors reservation list before the deadline.

I took a photo of the completed sample cap which didn't turn out too good. That cap looks much better than the picture. The current version has enhanced contrast and a bolder, more golden color text "Supporting NASA space grants since 2001". They also compensated for "pull effect", stitch error, etc. These measures have greatly increased the precision, light refraction, iridescence, and overall appearance of the entire graphic. Again, the picture doesn't reflect these enhancements. You can take my word for it, this is fine looking cap you will be proud to wear, display or give as a gift or award. FlexFit is our cap of choice, two sizes fit all (S-M and L-XL), very high quality, 63% Polyester, 34% Cotton, 3% Spandex, is medium gray color with charcoal sandwich brim. From the rear it appears to be a fitted cap (no adjustment strap or opening). Gold text color was chosen for a good contrast with gray background material -- in memory of Michael Gray KD7LMO-SK. I will attach the picture and one of the graphic files. Donation level for the cap is $20. Please specify quantity, size of each cap, either S-M or L-XL and personalization text (up to 8 char.).

If you would like more info or have specific questions, let me know. If you want some of these with custom personalizations on any of the remaining panels, our vendor is offering ANSR donors a minimum of 50% off their already low embroidery charge. For instance, you could add Michael's call sign or "Michigan" his favorite sport venue or just be creative. A friend suggested, "Flew it to the edge of space and all I got is this hat!". Then there's the all-time favorite, " <--- I'm with Stupid!". Our vendor has been excellent to work with. If you prefer to place an order later, and if the ANSR board votes to repeat this offer in the future, and if (that's a lot of if's) you decide to take advantage of our vendors generous discount, then you'll be pleased with their professionalism. In most cases, you can drop by, or better still, call for an appointment and they will embroider your order while you wait.

As an ANSR donor you can add anything alpha-numeric, any color, any size up to 2.25 inches tall, multiple lines or a full wrap around edge to edge of the ANSR/sphere graphic can be added for less than half of the normal charge. If we request additional personalization on the caps before they start production, ANSR will pass that cost, as well as your postage or shipping cost, on to you without any markup. The vendor may add a small handling charge to ship large orders. Their location, mailing address and contact info is included with each cap.

Caps will be available at the Williams' Ham Fest and the next regular ANSR meeting Monday 07-19-10, 1930 hours, ASU Tempe Campus, Orange Mall, Moeur Bldg. Watch these:
www.ansr.org <http://ansr.org/> or
http://groups.yahoo.com/group/Ballooning/
sites for meeting notices and talk-in details.

Best regards,
James, AC7ZT
Arizona Near Space Research
An Arizona non-profit 501(c)(3) organization
Promoting science, technologies and education (STEM; NASA) by exploring frontiers in amateur radio and high altitude ballooning.

PS. If you know the address of someone who has supported, or would like to support ANSR endeavors, please feel free to forward this to them.
Cross-posting to other enthusiats use-net and remailers is encouraged.

That was that long duration floater. the one and only one we had. it took off from the usual location near Hillsboro, WI.

In days LONG before GPS's were available. So location was everyone sending in 2 meter beam headings via packet reports and on the 40 meter tracking net.
Launch was close to 6 am sun up, and went till just after sunset it finally popped when people had a visual on it.
The Crazy thing according to all the beam headings made it close to the Indiana/Ohio/Michigan border, then came all the way back till it was floating directly over Elgin, IL. and my brother in laws house he was watching it through his telescope. and he seen it pop. then it started to come down.

Of course all day we were talking to Chicago centere, letting them know where it was at out best guesstimates from those days. and we seen the trend of where it was going. Luckily this was still at the time of the cool supervisor we had those days.

Once it seemed lower we stayed on the phone relaying directly to him live out guestimates. and when it was one the ground seven groups of chasers all had it inside the fence.

He had no problem. He said he even seen it come in on their radar, well he said they did so, what am i to question. at any rate he had no problem, He know it was under exampt spec's and then some. the whole thing maybe weighed a pound, in one small styrofoam box. the density was like 10% of the limit at the most.

Matter of fact he told us where to meet their security guys at what gate so they can cvome in and fox hunt it down with them. It landed between a fed ex taxi way and an american taxi way near some other actual runway.

But he was cool, and said wth the spec of the payload he's not concerned at all. cool dude!

Here is where a steerable chute would have been a good thing to have instead of being against the law,?

The recovery rate is greatly helped by living where trees are few and far between! I can take you right to about 5 UTARC payloads, swinging gently in the canopies of 100+ foot tall trees in a national park :-).

Thanks,
Dan

Perhaps there has been some confusion... I don't actually work for Sparkfun, I just use their stuff a lot and frequent their website. David Stillman, KI6YMZ, works for SFE, and was one of the driving forces behind the project. However, I wholeheartedly agree that it's great to have them nearby... there's nothing like paying for overnight shipping in the form of USPS first class!

73's,

David Patterson

Hi David,

Hey, I've used SparkFun stuff in some EOSS payloads, most recently the
SamCam II:

http://www.eoss.org/hardware/samcam2/index.htm

It uses one of your gear motors, a PICAXE-8, a rubber-tired wheel,
Nd magnets and reed switches.

I really appreciate having an outfit like yours in the local area.

BTW, if you'd like to learn how EOSS has earned its 100% recovery rate out
of 152 flights to date, come on out to one of our flights:

http://www.eoss.org/flight/

We're flying EOSS-153 out of Greater Downtown Deer Trail (school grounds)
this Sat 7/10 at 0700 MDST.

Is anyone planning to stream video of the GPSL 2010 conference?
If so, I may have to arrange for a vacation day so I can play along at home.

I've toyed with the idea, but I don't have a definitive answer at this point.

The bigger question is probably whether or not there is sufficient interest from the community that won't be able to attend?

Easy enough to set up. Both Bill Brown and myself have used http://batc.tv/ch_live.php to do it before. In fact Bill did it last year from GPSL.

Sympatico. We've seen some of that ourselves at GPSL and even one that
we launched from the CU campus in Boulder that got a spoofed cutdown just
a minute after launch. It landed in a 100-ft oak tree, and we called the
Boulder FD's ladder truck to retrieve it. Then there are the three that
have landed across power lines - think of trees that bite!

I guess youse guys include a chain saw in your recovery go-bag? Or maybe
a potato gun like one of the guys demoed at GPSL last year or so?

Yet another way to built balloon payload enclosures:

http://www.theregister.co.uk/2010/07/06/paris_glue/

I've found hot-melt glue to work quite nicely with foamcore board. It's flexible enough to hang in thru a rough landing and tolerates low temps nicely as well.

Hi Zack

Leigh and I couldn't make it this year due to some health issues. If it were streamed, I'd be glued to my screen. ;-)

I've toyed with the idea, but I don't have a definitive answer at this point.

The bigger question is probably whether or not there is sufficient interest from the community that won't be able to attend?

I may get some video edited into reasonable chunks from BASE 44. BASE 45 was a video/photo free flight. The extra weight went into the geiger counter experiments.

ABSOLUTELY!

Our payloads are one piece molded styrofoam construction. But the attachment of all the equipment is done via Hot Melt Glue Gun. It holds great, and can easily removed with little to no damage.

I'm trying to attend every launch here in Hawaii even if it is around 2:00 or 3:00 AM local time here on the APRS map.
I already spent a lot of $$ om equipment for a launch in Hawaii that never going to happen :(To much ristricted airspace here.

Hi Don,

The BATC web site has an online chat feature to the right of the live TV image. It's pretty kewl, but you might have to ask how to set your callsign as an alias.

Hi Mike,
Thanks for the update.
I still have a lot of planning to do and I'm not going to rush it for now. Watching all the launches on the mainland and follow them on Aprs which is really great and a trill for me, even if it's 3:00 in the morning here. Love that country side, one day I'll come over for sure.
Nop the FAA did not get back at me yet, give them some more time, w'll see.
Thanks again.

Freddy

Subject: [GPSL] streaming video

Is anyone planning to stream video of the GPSL 2010 conference?
If so, I may have to arrange for a vacation day so I can play along at home.

Rog KC0MWM

7565. GPSL Symposium on the Web

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-08 01:47:59 UTC
From: Zack Clobes
Topic: 7565 Message: 7565

Well, it certainly looks like there is some interested in a web presence, so we will give it a try. I have a WebEx account, and will tie the video and audio in, along with the PowerPoint slides. I will work on the logistics, but keep an eye on the GPSL Yahoo group for login information.

Zack Clobes, W0ZC
Project: Traveler
www.projecttraveler.org

7566. [GPSL] streaming video at GPSL will happen both days

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-08 01:50:53 UTC
From: wb8elk@aol.com
Topic: 7541 Message: 7566

I plan to stream video for the entire conference on Friday as well as the Superlaunch and chase/recovery on Saturday.

www.batc.tv click on Members Streams....then select: WB8ELK

There is a Chat Room next to the video stream window.

I'm trying to attend every launch here in Hawaii even if it is around 2:00 or 3:00 AM local time here on the APRS map.
I already spent a lot of $$ om equipment for a launch in Hawaii that never going to happen :(To much ristricted airspace here.

Subject: [GPSL] GPSL Symposium on the Web

Well, it certainly looks like there is some interested in a web presence, so we will give it a try. I have a WebEx account, and will tie the video and audio in, along with the PowerPoint slides. I will work on the logistics, but keep an eye on the GPSL Yahoo group for login information.

We can handle 25 simultaneous connections via WebEx.

Hi Joe,

Maybe you're using a lot cooler hot melt than I do. My experience hitting styrofoam with hot melt reminds me of the China Syndrome. The paper on the foamcore holds things in place, despite the glue boring deep into the foam.

I thought the drinking straw approach might be neat if one needed a scaffold structure of some type.

Really? Yes we have and do have some China Syndrome effect. But not
all that much. But maybe we do it differently? We put the glue on the
radio, PC board, battery or whatever is being mounted, and then it is
inserted into the box. Maybe it cools enough to avoid the massive
melting, yet is still soft and sticky enough to ensure a strong grab?
Worst case it, sinks into the foam a bit more he he he.

That is cool. I will have to remember that. I always wanted to try a
payload that was skeletal like that but never thought of a good and
strong way to make the framework without it being too heavy.

Reason was it was an experiment on keeping the payload warm. Of course
99% if not more traditional thought is Styrofoam, and as much as
possible. But what are we trying to do?

Keep the Heat loss down right? Also known as heat transfer.
Heat transfer is the transfer of heat from one place to another by
movement of energy. When an object is at a different temperature from
its surroundings or another object, transfer of thermal energy, also
known as heat flow, or heat exchange, occurs in such a way that the body
and the surroundings reach thermal equilibrium; this means that they are
at the same temperature. Heat transfer always occurs from a
higher-temperature object to a cooler-temperature one as described by
the second law of thermodynamics or the Clausius statement. Where there
is a temperature difference between objects in proximity, heat transfer
between them can never be stopped; it can only be decreased. One of the
reasons we use Styrofoam in our payloads. It is a good insulator,
blocks the flow of the heat energy, and is a lightweight frame structure.

Heat Transfer or "Loss" can happen three ways.

(Wikipedia is cool!)

1 Conduction
2 Convection
3 Radiation

Conduction

Conduction is the process of heat transfer through a medium or material without any movement of the medium or material. Conduction is also the transfer of heat by direct contact of particles of matter. The transfer of energy could be primarily by elastic impact as in fluids or by free electron diffusion as predominant in metals or phonon vibration as predominant in insulators.In other words, heat is transferred by conduction when adjacent atoms vibrate against one another, or as electrons move from one atom to another. Conduction is greater in solids, where a network of relatively fixed spacial relationships between atoms helps to transfer energy between them by vibration.

Heat conduction is directly analogous to diffusion of particles into a fluid, in the situation where there are no fluid currents. This type of heat diffusion differs from mass diffusion in behavior, only in as much as it can occur in solids, whereas mass diffusion is mostly limited to fluids.

Metals (e.g. copper, platinum, gold,etc.) are usually the best conductors of thermal energy. This is due to the way that metals are chemically bonded: metallic bonds (as opposed to covalent or ionic bonds) have free-moving electrons which are able to transfer thermal energy rapidly through the metal.

As density decreases so does conduction. Therefore, fluids (and especially gases) are less conductive. This is due to the large distance between atoms in a gas: fewer collisions between atoms means less conduction. Conductivity of gases increases with temperature. Conductivity increases with increasing pressure from vacuum up to a critical point that the density of the gas is such that molecules of the gas may be expected to collide with each other before they transfer heat from one surface to another. After this point in density, conductivity increases only slightly with increasing pressure and density.

Convection
Convection is the transfer of heat from one place to another by the movement of fluids. The presence of bulk motion of the fluid enhances the heat transfer between the solid surface and the fluid.

There are two types of convective heat transfer:

* Natural convection: when the fluid motion is caused by buoyancy forces that result from the density variations due to variations of temperature in the fluid. For example, in the absence of an external source, when the mass of the fluid is in contact with a hot surface, its

molecules separate and scatter, causing the mass of fluid to become less dense. When this happens, the fluid is displaced vertically or horizontally while the cooler fluid gets denser and the fluid sinks. Thus the hotter volume transfers heat towards the cooler volume of that fluid.

* Forced convection: when the fluid is forced to flow over the surface by external source such as fans and pumps, creating an artificially induced convection current.

Internal and external flow can also classify convection. Internal flow occurs when the fluid is enclosed by a solid boundary such as a flow through a pipe. An external flow occurs when the fluid extends indefinitely without encountering a solid surface. Both of these convections, either natural or forced, can be internal or external because they are independent of each other.

Radiation

Radiation is the transfer of heat energy through empty space. All objects with a temperature above absolute zero radiate energy at a rate equal to their emissivity multiplied by the rate at which energy would radiate from them if they were a black body. No medium is necessary for radiation to occur, for it is transferred through electromagnetic waves; radiation works even in and through a perfect vacuum. The energy from the Sun travels through the vacuum of space before warming the earth.

Now How does this all effect How heat is lost in a typical payload?

What are the ways heat is lost?

1 Conduction
2 Convection
3 Radiation

Well conduction is mainly in the form of heat sinks. The heating of the parts of the radio, and heat sinks. Anything in direct contact with the heat generating device. And of course all a heat sink is, is a way to enhance the other two ways heat is lost by Convection and Radiation, by expanding the surface area of the heat generating device. For the most part this is a fixed thing, we can not minimize this heat loss, other than by removing any heat sinks. but then we jeopardize the device from getting too hot also. It Sucks to be Goldilocks, It's either too hot or too cold, it's never just right! and not a lot we can do about it, other than not adding any more heat sinks. "Maybe"? "Maybe Not!" But of course the effectiveness of the heat sink depends on Convection. And Radiation.

Convection,
Now this is a very important one to think about in our payloads. The normal heat loss is to happen with a radio at sea level is all three modes. and in the triangle of convection the "Fluid" of transfer is

"Air" But at altitude this "Fluid" is missing, or at least it's density is greatly reduced. So that any heat transfer "Loss" is reduced greatly if not completely when at high altitudes. So this mode of heat loss is minimal at best.

So what's left Radiation,

Radiation is energy "Heat" loss directly to the depths of space, or at least to the payloads immediate surroundings. The amount of this loss of course all depends on the amount of "Heat" difference between the hot object and the "Space" around it. The "Hotter" it is the more pressure there is for the energy to try to radiate away. Kinda like voltage and a spark gap. So again we need to block this flow of energy with an insulator. But the problem is this mode of heat transfer requires nothing. It can do it's job just fine even in a total Vacuum!

But we need to block this flow. Think of Solar energy as this heat. and it is more or less, just different wavelengths. So light is this "Flow" of energy from a hotter object "Sun" to cooler areas and objects. Heat is mainly in the infrared portions of the spectrum.

Lighter colors and also whites and metallic substances absorb less illuminating light, and thus heat up less; but otherwise color makes small difference as regards heat transfer between an object at everyday temperatures and its surroundings, since the dominant emitted wavelengths are nowhere near the visible spectrum, but rather in the far infrared. Emissivities at those wavelengths have little to do with visual emissivities (visible colors); in the far infrared, most objects have high emissivities.

Thus, except in sunlight, the color of clothing makes little difference as regards warmth; likewise, paint color of houses makes little difference to warmth except when the painted part is sunlit.

The main exception to this is shiny metal surfaces, which have low emissivities both in the visible wavelengths and in the far infrared. Such surfaces can be used to reduce heat transfer in both directions; an example of this is the multi-layer insulation used to insulate spacecraft.

And That is exactly what I was thinking of building. Using a multi layered box made only of aluminized mylar. Stretched over a framework. Because think of it.

with the three modes of heat loss, Because of the vacuum, the only real mode of heat loss is from Radiation.

Conduction, (heatsinks) still use Convection and Radiation to dump the heat is is absorbing from the heat generating device, and if there is no Convection because of the Vacuum,,, there is only Radiation to be the one and only way we have heat loss in our payloads.

Just like a thermos bottle, a Dewars Flask.

A practical vacuum flask is a bottle made of metal, glass, or plastic with hollow walls; the narrow region between the inner and outer wall is evacuated of air.(Just like our payloads are evacuated of air,) Using vacuum as an insulator avoids heat transfer by conduction or convection. The only remaining method of heat loss is Radiation. Radiative heat loss can be minimized by applying a reflective coating to surfaces: Dewar used silver. At the temperatures for which vacuum flasks are used (usually below the boiling point of water), and with the use of reflective coatings, there is little infrared (radiative) transfer.

So in effectiveness (is that a word?) our payloads are flying thermos bottles! That is if we add shiny reflective coatings.

This would truly be an interesting experiment. construct two identical payloads,

with exactly the same two heat generating devices, attached to small heat sinks? but with temp measuring devices attached.

Place one in a standard thick 1 to 2 inch thick Styrofoam box, and the other is a simple several layer of mylar wrapped around it only and fly them and see how they run temp wise.

Now back onto heat loss. and sometimes we may have a payload that is 40 below inside, But the equipment still overheats!

WHAT?

Yup we actually have had this happen.! We flew our Crossband repeater the Standard C-528A

On the ground we have ran it for hours and hours at the 2.5 watt level and never had a problem.

In the payload of course we don't need that much power and run it at the 300 milliwatt level.

The first flight there wasn't a LOT of activity, and it worked flawlessly, But one thing we did notice on recovery was that the radio had separated from the hot melt glue. The glue was still tight in the Styrofoam, but almost none was on the radio. weird we thought.

The next flight we did with that radio was the infamous flight that beat the hell out of that radio,, because of the freqs we choose on that flight 146.52 and 446.000

the level of activity was well. incredible. the radio was at 100% duty cycle! You all know the feeling of a HT when talking for a long time, The case (heatsink) gets hot. And thats with just like 50% duty cycle. This was running 100% non stop. well, take that back 95%? i guess there are small pauses between transmissions.

almost 90 minutes of this transmission (80K feet) of course the box is easily below zero right now, But the repeater goes silent. upon

retrieval, we again find it separated from the hot melt, and even a
rubber part of the radio itself has separated from the radio and even
looks like it was somewhat melted even!

Thats when we thought about all the above stuff and heat loss. How was
this HT and it's heat sink(the case) to loose the heat it is generating?

Conduction?
Well a little, to the hot melt Glue, of course once thats melted away,
thats gone.

Convection?
Nope little here the Vacuum of space and all that.

All that leaves is radiation.

And the surface area of the heat sink (the case) isn't large enough to
Radiate the heat fast enough.

We added to the main heat area of the HT a thin. Plate of aluminum, 3"
wide by 8" long, to add in the surface area of the heat sink. To enhance
the radiation properties. And surface area.

The next flight that happened it again was near 100% duty cycle, but it
never stopped working.

so even if the payload is cold inside your equipment can still overheat.

The space blanket experiment still seems interesting.

Hi Freddy,

Have you submitted a HiBal Notice per FAR-101 yet? If that yields no response, then perhaps the FAA really doesn't have any objections. But most likely, that will prompt a response, even if your HiBal is just a trial balloon, so to speak. Just be sure to cancel it at least a day in advance.

Here's some info on sectional charts, with links to online charts and tips on how to read them:

http://en.wikipedia.org/wiki/Sectional_chart

If you express some familiarity with terms in the sectionals, it'll help develop some confidence with the FAA folks that you've done your homework.

Yeah, radiative heat transfer is about all you have if you're loitering
in the stratosphere. But if you're flying a properly inflated latex, then
there's still some forced convection on the outside of the payload enclosure,
and the "working fluid" is darn cold! Lots of folks have noticed that their
external air temp telemetry usually dips lower going thru the tropopause
during decent that it did on ascent - this is because descent airspeed at
that altitude is a lot greater than the typical 1000 fpm ascent, so the
convention coefficient is also larger, thus coupling the temp sensor more
closely to the ambient air.

One way to handle heat sinking in the absence of convection is by providing
a large area heat sink, preferably painted with carbon black pigment paint.
Note that black anodize, as found on some commercial heat sinks, looks
white at IR, so it doesn't radiate well. Just paint it with carbon black,
and point it towards an external payload wall, maybe also painted black.

The rate of radiative transfer varies as the 4th power of temperature
difference, so it does pretty well.

I've got some, but it's got a bare foam surface on one side, so it
doesn't form up as neatly as standard double-sided foam core. If you
need a higher R value, get thicker foamcore, or line it with thin
bubble wrap. Kitchen-grade Al foil can be bonded nicely and quickly to
foamcore using ordinary Elmer's glue.

I'll use the space blanket you can buy at camping stores. It gives the near spacecraft more a spacecraft look.

I'll also layer it with scrim (wedding veil material) to make multi-layer insulation.

Too bad you can't get the Gold colored stuff. then it REALLY would
look spacecraft like.

I have a source of that. The Cosmosphere sells it in their gift department.

I purchase a packet last year and sell it in my BalloonSat kit.

The yellow stuff in real life if Kapton plastic with a coating of aluminum. Kapton is yellow in color. Kapton tape is also used to hold together MLI (along with sewing). I've experimented with this stuff and it can be fun to make. I'm just not sure our vacuum is hard enough to make it very effective. Tests show it does have an effect and they use it for cyro systems.

That's great news! Mike Gray was ANSR's key payload developer and
built some pretty nifty stuff.

Very true Mike,

He made a huge contribution to HAB, Space Grant, S.T.E.M. and Amateur Radio and especially ANSR.

Thank you for your comment and the cross-post to this group.

Regards,
James AC7ZT

APRS on 144.39: WB8ELK-11
APRS on alternate frequency (144.34 or 144.36?): WB8ELK-10
DominoEX22/300 baud ASCII RTTY/Hellscreiber/CW on either 144.31, 144.34 or 144.36 (it's frequency agile so can go anywhere if conflicts).

434 MHz Fast Scan ATV

From: ronald74
Topic: 7594 Message: 7594

I set up the ARHAB twitter account a year ago and I appreciate it seeing it tight on the GPSL website, but it appears when I handed it over to the ARHAB website owner at the time, it really has not seen any new tweets. If someone who has the new ownership to it wishes help with it I would be happy to keep it updated with information.

Thanks, Ron aprsdash9@...

7595. Long range forecast for the 24th

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-13 00:50:35 UTC
From: Mark Conner
Topic: 7595 Message: 7595

Looks like it should be hot and humid, but only a minimal threat of thunderstorms and any that form are likely to be in the afternoon. The jet stream will be pushed well north into Canada and it's unlikely any frontal systems will be passing through southern Kansas late next week.

Winds below 50,000 ft will generally be light from the south. The high-level winds will be from the east, so at this point I think landings will be WNW of the launch site. The situation may be similar to GPSL 2002 from Herington, where the balloons initially traveled north a few miles, then west until burst.

Wish I could come down this year but I've already used up a lot of my vacation days for other balloon activities.

7596. Quick Update

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-13 02:20:27 UTC
From: Zack Clobes
Topic: 7596 Message: 7596

Regarding the time slots and current flight configs, I thought that I could just copy/past my data into an email, but it re-sorted the columns for me (thank you very much Google), and it's going to take a bit to get them straightened back out. I will try to get a full list posted tomorrow, but currently I have the following groups/balloons with information:

Near Space Ventures
Dryden Engineering
EOSS
ROBOMO
ARBONET - 6/15/10
WB8ELK
ROBOMO
Nick Stich / K0NMS

I had the privilege to visit SparkFun last week, and got to meet the owner Nate who was the one who posted about his most recent HAB project. I'm bad with names, but I believe it was Dave who was giving the tour and has also flown some HAB.

SparkFun DID donate two additional prizes to GPSL 2010. I'm keeping them out of arms reach for now... I sure hope the dog doesn't eat them or anything.. :-)

I also have about 60 copies each of Circuit Cellar and Elektor magazines that will go to the first 60 through the doors on Friday!

7600. BASE 46

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-14 00:56:59 UTC
From: BASE
Topic: 7600 Message: 7600

Dear friends,

BASE 46 will fly on Thursday, 15 July 2010. Launch will be approximately 1400 UTC (10 am Eastern Daylight Time) from the Northmont Schools, Crawfordsville, Indiana (40.11 N,86.91 W). We may launch earlier, if we're ready. Thunderstorms are forecast for the late afternoon and it would be nice to be out of the field by then.

Again, we will fly APRS on 144.39 MHz using no path and two minute intervals to minimize our footprint.

Predicted landing, assuming 85 kft burst with 1000 ft/min ascent, is about 15 miles at a heading of 100 degrees from the launch site. Hopefully we can find a bean field, but corn is better than trees.

Thanks for your support,
Howard

7601. WX Alert

Date: 2010-07-14 22:36:35 UTC
From: HarryM
Topic: 7601 Message: 7601

I hope the WX retreats a little for GPSL from the current 90-100 degF, high humidity & dewpoint. If the current conditions stay in place it will make for sweltering recoveries, especially if we have to truck across country. Make sure you bring plenty of water and/or other hydration fluids.

Hutch airport is at 1543 ft and the density altitude right now is 4500 ft.

Right now it doesn't look like it will - expecting mid-90s in the afternoons with dewpoints in the high 60s to low 70s for the 24th.

Here in Omaha today we had temps at 93-95 with a dewpoint in the low 80s. Ugh.

The oscillator could have stopped... Condensation, mechanical disconnect, temperature?

Condensation is possible - we launched in a light rain and the glitch occurred at 13,000 ft on descent, after the payload was cold-soaked and descending into a moist layer. Internal temps were not unusual and the oscillator is an SMD right on the stamp itself.

That's almost exactly what happened on our very first flight. In our case though, it was a through-hole ceramic resonator on a homemade PCB. I believe that it started back up right after impact, presumably after the water was knocked off the board.

Ever since the, we always put conformal coating on our boards before the fly.

I'll look to see if the BS2 has a coating. Don't think so.

We've had a number of flights where the interior of the payload had plenty
of condensation with no ill effects, but maybe this was worse.

7609. Time Slots

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-15 00:24:03 UTC
From: Zack Clobes
Topic: 7609 Message: 7609

OK, the long awaited slots list... There were a couple of you that requested specific slots already, but I had to adjust them slightly in order to fit everyone in. If this can't be done, please let me know ASAP and I'll try to find a work-around.

The following slots are for 144.34 only - I don't intend to assign slots to the .39 frequency unless we have overwhelming response otherwise.

EOSS - :00 to :05 seconds.
ROBOMO - :06 to :11 seconds
WB8ELK - :12 to :17 seconds
ORB - :18 to :23 and :48 to :53
Traveler - :24 to :29. I will also have a second transmitter on frequency, not slotted but only transmitting about every 90 seconds.
Nearsys - :30 to :35

I have a total of 13 flights (Near Space Ventures, Dryden Engineering, EOSS, ROBOMO (2), ARBONET, WB8ELK, Nick Stich, ORB, BASE - Depauw (2), Traveler, Nearsys). If you're not on this list, then I'm not expecting you...

A more detailed list will be uploaded to the www.superlaunch.org website soon.

7612. BASE 46

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-15 19:48:17 UTC
From: BASE
Topic: 7600 Message: 7612

Dear friends,

After a normal fill with more than the indicated lift weight of 9 pounds, for the 6.75 pound payload, the flight string was released at 1403 UTC. There were approximately 10 mile per hour winds from the south that gave some false lift and the fill over the asphalt parking lot did not seem to be a problem. About a quarter mile north of the launch, the flight string passed over a corn field and began to descend. The flight string was caught for a few minutes on some intermediate voltage power lines. The balloon won the battle and lifted the payloads off of the line and barely cleared the next grove of trees. All radio contact was lost after the power line encounter. The flight string crossed another corn field and cleared a second set of power lines before stopping in the top of a tall tree. Thankfully, the packages were caught and the winds brought the balloon to an early demise by popping it on the tree branches.

No APRS data made it to the internet because of the no path and low altitude.

Recovery efforts continue. The initial EZ Hang retrieval efforts were halted in the heat and humidity when the second lead weight broke free from the monofilament line.

Additional details are on the website: www.depauw.edu/acad/physics/base

Thanks for your support and interest.
Howard

We will be shutting down the online order form TOMORROW (Friday) NIGHT. PLEASE PLEASE PLEASE have all of your gas and symposium admissions placed by then.

www.custom-ds.com/gpsl2010/

After tomorrow, symposium admissions will only be available at the door for $20. Correct change (meaning bills, not pennies) is appreciated.

BTW, I have seen a few of you requesting additional time slots. That shouldn't be a problem, and will try to get those posted sometime Friday or Saturday.

From: Zack Clobes
Topic: 7619 Message: 7619

We definitely have some interest in streaming the symposium out to those who can't be here, and I know how painful it can be to listen to lousy audio all day.

I think I can come up with a small mixing board to accept the XLR connectors (and provide phantom if needed), but I'm having a hard time coming up with a couple of cordless lapels and even maybe some condenser mic's for general room mic'ing.

Can anyone assist?

Good question.

I'm strongly leaning towards WebEx, because I know it's a professional, high quality (paid) service. I like this because we can stream the video, audio, and screen sharing all down the same pipe, and don't have to worry about having both the presenter and the projector screen in view. But, it means that we'll be heavily dependent on a single computer, and I can only stream 25 attendees.

I've also heard some good things about UStream, which I'm looking into right now. I know Bill is a fan of Batc.tv.

All I know is that if I'm going to put myself through all of this, the last thing I want is a crappy stream. :-)

I do not know what it costs (if anything) but the webinars I have been
in with this group below is awesome!

There is the live video capability along with power point capability, a
text based chat room, AND the ability of viewers to on text or even
Voice ask questions.

it's super cool.

their archives is at,

http://www.casadelcrappo.com/pvrc-videos/

here they made a video of their past webinars.

Whats all involved in setting it up i do not know, but i bet they could
help you.

From: Meer, Stephen
Topic: 7623 Message: 7623

I can bring 2 wireless lav mic systems and 1 handheld wireless mic for audience pickup. These are all close in mics not room pick-ups.

Rcvrs are wall wart powered so wide spaced power strip or AC pigtails will be required.

Do you have XLR interconnect cables or do I need to bring some?

/s/SM2 K0SCC

Subject: [GPSL] Does anyone have any microphones that they could bring to GPSL for broadcasting the event?

We definitely have some interest in streaming the symposium out to those who can't be here, and I know how painful it can be to listen to lousy audio all day.

I think I can come up with a small mixing board to accept the XLR connectors (and provide phantom if needed), but I'm having a hard time coming up with a couple of cordless lapels and even maybe some condenser mic's for general room mic'ing.

Can anyone assist?

Zack,

Hope this isn☐t too whinny. Could Nearsys☐s slot be moved to :38 to :43?
We☐d like to beacon at both :00 to :05 and :30 to :35. The KPC we fly is
already programmed for two beacons per minute.

Thank for your consideration.

Nick

Subject: [GPSL] Time Slots

OK, the long awaited slots list... There were a couple of you that
requested specific slots already, but I had to adjust them slightly in order
to fit everyone in. If this can't be done, please let me know ASAP and I'll
try to find a work-around.

The following slots are for 144.34 only - I don't intend to assign slots to
the .39 frequency unless we have overwhelming response otherwise.

EOSS - :00 to :05 seconds.
ROBOMO - :06 to :11 seconds
WB8ELK - :12 to :17 seconds
ORB - :18 to :23 and :48 to :53
Traveler - :24 to :29. I will also have a second transmitter on frequency,
not slotted but only transmitting about every 90 seconds.
Nearsys - :30 to :35

I have a total of 13 flights (Near Space Ventures, Dryden Engineering, EOSS,
ROBOMO (2), ARBONET, WB8ELK, Nick Stich, ORB, BASE - Depauw (2), Traveler,
Nearsys). If you're not on this list, then I'm not expecting you...

A more detailed list will be uploaded to the www.superlaunch.
<http://www.superlaunch.org> org website soon.

Topic: 7628 Message: 7628

Sadly we have lost a comrade in ballooning & experimentation.

John Robbins NO5X (AD5GT) in Oklahoma City is now SK.

John & I spent many, many late nights on echolink and the phone developing several 2m CW beacons several years ago, a precursor to my 12mw CW beacon. John also came to Tulsa to help on recovery for several ORB flights. I went to OKC and spent several nights helping John build payloads and equipment for the DART balloon program and then to help on DART recoveries.

He will be missed!

GOD SPEED JOHN

I have used Ustream and have used it several times, and I have the capability to broadcast single camera with tripod and boom mic, but I could feed a mixer or such I dont have but can accept a 3.5mm audio plug) into a jack in the side of the macbook and get the audio that way which would provide excellent quality. It just takes having a decent internet connection. If we can settle on a method Im sure we can get some press out by emailing to about 100 radio clubs across the country, and it may be to late for news-line... but maybe something on QRZ and eham. Im sure we would get a good viewership. Of can always put it to hard drive and publish it afterwards. Both methods are in general relatively free.

One of the BASE APRS beacons will be on 144.39 at 22 seconds after the minute... The other tracker will I believe will be about 50 seconds on 144.39 according to Howard.

Also there will be a Domino EX-22 on 146.560, and I will be igatefrom the recovery vehicle with an evdo card piping 144.39 into Aprs.fi and to nearspace.us on 146.56 Domino tracker (n9qgs-)

Things are shaping up. Ron N9QGS

Subject: [GPSL] Are you staying at the Holiday Inn Express for the meeting?

Dear friends,

I will be contacting the Holiday Inn Express folks about the possibility of using their conference room for the post-flight debriefing on Saturday. I am seeking use of the room at no cost, since I paying for two rooms for three nights already. I believe that my argument could be strengthened by knowing how many other GPSLers are staying there.

Responses to the list are fine, or you can e-mail me directly.

Thanks,
Howard (hlbrooks@...)

From: Nick Hanks
Topic: 7643 Message: 7643

EOSS will depart Limon*, CO Wednesday morning at 0800 (0900 CDT) for Hutch via I-70. There will be six vehicles all running APRS with a -6 SSID. We expect to be in the Hutchinson area a little before 1700 CDT. We'll give a call on the 147.12 MHz repeater as we approach Hutch. Enroute simplex frequency is 146.55 MHz. We leave I-70 at Lyons, KS and drive down Rt. 14 through Nickerson and on into Hutch.

We'll have mobile Web access so we'll be I-gating ourselves and will put out tweets too. You can learn all about Twitter and how to join at http://www.eoss.org/twitter.htm. We'll be sending out tweets on our way out and back, while we're in Hutch, and on Saturday during the launch and recovery activities. Our Webmaster N0KKZ has put together an excellent tutorial on getting started. And you can only subscribe to EOSS tweets if you want.

In addition, four of the vehicles have HF capability and will be monitoring 7.234 MHz and 14.275 MHz at :30 past the hour unless we're on a gas stop or the lunch break. Give us a call!

Nick N0LP

EOSS GPSL Coordinator

* Limon's about 70 miles east of Denver. It's where we all converge to start the trip together.

Lorraine is totally open, and has been. That's kind of strange.

I can't think of any major construction in the area that should affect any
of you - most of it's just residential re-surfacing, but not in the eastern
part of town.

From: Zack Clobes
Topic: 7646 Message: 7646

The access to the "Hall of Space" should be free to all of the GPSL attendees either Thursday or Friday (and I'd image that Saturday would work too). Friday will probably be pretty tough for most of us, since they close at 7pm.

Just tell the front desk that you're with the balloon group - if they give any flack over it, Janet Fischer (in charge of facility rentals) is probably a good name to drop.

Given the forecast short flights, you'll probably have some time to kill on Saturday afternoon. The underground salt museum would be a good place to visit.

Although it won't affect many of us, there was a partial road collapse in the Kansas City, Missouri area. You can't go from I-470 west to I-435 west. Here's the link:
http://www.kansascity.com/2010/07/18/2091494/triangle-interchange-may-not-open.html#ixzz0u3koWcfp
Fortunately, I-435 is open and an easy way to get from I-70 to I-35 without going through downtown KC. Probably only matters for me, the NSV folks, and ROBOMO.
We're hoping to make it to Hutchinson in time for dinner at Ken's on Thursday.
See you then,Howard

Sorry guys, I just caught this.

Paul needs to move his slot to 24-29 seconds. The 36-41 had already been assigned to ARBONET. EOSS can have 0-5 and 30-35. Traveler is going to QSY to 144.39, because I just don't have time to mess with slotting right now.

I will work with Keith to get the newest scheduled uploaded to superlaunch.org ASAP.

ARBONET will be QSY on 144.390 as well. The Open Trackers just are not working for me today.

If someone needs our time slot on 340, it is open.

Do we have time slots for the 390, since several of us will be there as well?

I am not coordinating slots on .39. My recommendation would be to use a
simple delay of 35 seconds between packets to keep the slot rotating.

Sorry, I'm afraid it would be best if you re-programmed it. At :34, you're
right in between EOSS and ARBONET's slots, and liable to conflict with both.

From: Michael Willett
Topic: 7658 Message: 7663

ARBONET will not have a radio on 340, we will be on 390. My slot is free to Paul if he needs it.

I could not get the Open Tracker to work for me this trip, so I will be using a Tiny Track on 390, so therefore no time slot required.

From: Michael Willett
Topic: 7658 Message: 7665

I think Zack is only coordinating 144.340. So you can leave your system
as is Paul. I will program mine for 125 seconds between check-ins and
that should be random enough.

EOSS just beacons a GGA frame at 0:30, so there should be no risk of
collision with Paul at 0:34.

7667. APRS on 144.390

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-20 20:04:04 UTC
From: Michael Willett
Topic: 7658 Message: 7667

It sounds like several of us will be working with balloons with
non-agile radios on 144.390

For flights on 144.390 we have:

EOSS @ 0.30
Near Sys @ 0.34
ARBONET every 125 seconds

Are there other flights planning to be on 390?

--Michael K5NOT

It sounds like I have enough help to launch. Tracking equipment I'm not sure about. Zack, what are you bringing?

I've got a D-7 and GPS 5. It works, but is limited.

Subject: Re: [GPSL] Time Slots

Sorry guys, I just caught this.

Paul needs to move his slot to 24-29 seconds. The 36-41 had already been assigned to ARBONET. EOSS can have 0-5 and 30-35. Traveler is going to QSY to 144.39, because I just don't have time to mess with slotting right now.

I will work with Keith to get the newest scheduled uploaded to superlaunch. <http://superlaunch.org> org ASAP.

Zack,

Hope this isn□t too whinny. Could Nearsys□s slot be moved to :38 to :43? We□d like to beacon at both :00 to :05 and :30 to :35. The KPC we fly is already programmed for two beacons per minute.

Thank for your consideration.

Nick

Subject: [GPSL] Time Slots

OK, the long awaited slots list... There were a couple of you that
requested specific slots already, but I had to adjust them slightly in order
to fit everyone in. If this can't be done, please let me know ASAP and I'll
try to find a work-around.

The following slots are for 144.34 only - I don't intend to assign slots to
the .39 frequency unless we have overwhelming response otherwise.

EOSS - :00 to :05 seconds.
ROBOMO - :06 to :11 seconds
WB8ELK - :12 to :17 seconds
ORB - :18 to :23 and :48 to :53
Traveler - :24 to :29. I will also have a second transmitter on frequency,
not slotted but only transmitting about every 90 seconds.
Nearsys - :30 to :35

I have a total of 13 flights (Near Space Ventures, Dryden Engineering, EOSS,
ROBOMO (2), ARBONET, WB8ELK, Nick Stich, ORB, BASE - Depauw (2), Traveler,
Nearsys). If you're not on this list, then I'm not expecting you...

A more detailed list will be uploaded to the www.superlaunch.
<http://www.superlaunch.org> org website soon.

From: Zack Clobes
Topic: 7637 Message: 7677

For food, there's nothing really close to the Cosmosphere, other than the internal snack bar place. I think they have burgers and pizza, although it's probably not what I would call... fresh.

If EOSS is coming from the salt mine, heading for the Cosmosphere, I would probably recommend:

Airport Steakhouse - I think they only do buffet for lunch, although I'm not positive. It's at the airport. Or on east 11th by the mall, there is Arby's, Lone Star Steakhouse, McDonalds, and Fazoli's.

One other place that you might consider since it's liable to be HOT Thursday is Bogies on Plum, just north of 17th. That's the burget joint that we ate at a few years ago at GPSL when we were at the Juco. They're slow, but they have good ice cream shakes.

Zack

That's about right from Topeka. I like to come down the turnpike, either through Newton or McPherson.

For food, there's nothing really close to the Cosmosphere, other than the internal snack bar place. I think they have burgers and pizza, although it's probably not what I would call... fresh.

If EOSS is coming from the salt mine, heading for the Cosmosphere, I would probably recommend:

Airport Steakhouse - I think they only do buffet for lunch, although I'm not positive. It's at the airport. Or on east 11th by the mall, there is Arby's, Lone Star Steakhouse, McDonalds, and Fazoli's.

One other place that you might consider since it's liable to be HOT Thursday is Bogies on Plum, just north of 17th. That's the burget joint that we ate at a few years ago at GPSL when we were at the Juco. They're slow, but they have good ice cream shakes.

We've had lot's of difficulty with this before - we're just not worth the effort for most insurers to deal with. However, when we did some flights on someone else's tab, we used Falcon Insurance in Texas. Pour yourself a drink before asking for a quote, but I promise it won't be as bad as some other places!

7692. De-briefing Scheduled for Saturday afternoon

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-21 14:22:51 UTC
From: Zack Clobes
Topic: 7692 Message: 7692

Given the close-in proximity of our flights, I've went ahead and scheduled the meeting room at my workplace Saturday from "about after lunch to dinner time". I know that's a bit vague, but it's largely dependent on me finding my payload, and getting back into town.. ;-) So, if I'm stuck in a tree and you want a cool place to hang out.....

The location will be at Hutchinson Credit Union (900 E. 23rd Ave) at the corner of 23rd and Severance. There's an employee door just to the north of the main entrance. Press the doorbell next to that door, and someone will be up to let you in.

The meeting room holds about 50 comfortably, we have chairs, tables, projector, DVD player, etc...

So, watch Twitter for updates on the availability of the room. I will also try to monitor the 147.12+ repeater.

7696. Hacking the "Spy" cameras for use in balloon payloads.

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-21 16:19:39 UTC
From: Bruce Coates
Topic: 7696 Message: 7696
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Everyone

I had planned on getting this documentation cleaned up before sending it out but it's still on my ever growing to-do list. Rather than wait, I wanted to get it out before GPSL in case people are interested.

Basically, this a way to hack into the "Mini DV" and "Chewing Gum" "spy" cameras you find on eBay. It gives you a way to control them with just 3 wires.
- +5v
- Ground
- 3.3v signal wire

The 5v and ground are simply connected to the USB port on the camera. The 3.3v signal line is connected to the shutter button. When you apply 5v, it charges the battery and powers up portions of the camera. This generates enough heat to keep the camera from freezing when it's not recording video. When you remove the 5v, the camera reverts to a "ready to record" state for 30 seconds. If you do nothing, it will power down after 30 seconds.

The signal line logic is different for the two cameras. For one, pulling the line up to 3.3v simulates pressing the shutter button while you have to ground the line on the other model for the same effect.

When I'm recording I also stop and start the video every 10 minutes. This reduces the likelihood of a corrupted video file due to a dead battery or full SD card. It also breaks it up into 9:55 clips, just right for You Tube. ;-)

So now, the sequence my camera controller goes through is:

- Apply 5v for about 15 seconds.
- Remove 5v. I now know both cameras are ready to record.
- Press the shutter to begin recording. (Briefly apply 3.3v or ground to signal line)
- Every 10 minutes I:
- Press the shutter to stop recording.
- Wait 10 seconds for the cameras to close the files.
- Press the shutter to begin recording.
- At 10,000 feet or maybe higher, I stop recording and set the cameras into recharge/keep warm mode. Things are a bit boring in that range and this extends my battery life.
- At 60,000 feet I begin recording again.
- I usually continue recording in 10 minute chunks all the way to burst and back to the ground.

I hope this sparks some interest and discussion at the conference. I can't attend in person but thanks to the efforts of the organizers I'll be watching from the comfort of my easy chair.

My new BalloonSat flight computer designs incorporate a 5V trigger for cameras (so you can use the CHDK USB remote). I'll take a look at your notes and will incorporate that into the newer design.

Thanks,
Paul

As I've let people know offline, I am OK with switching to hosting in Omaha in 2012 if there is consensus to do so. Feel free to discuss this on Friday and let me know - I don't have any particular inputs to add to the discussion. Wish I was going to be there, but even if I had been planning to attend some things have occurred in the last week that would have forced me to back out this year anyway.

I would love to see it in Pella! Iowa is a wonderful place.

It's this weekend at the end of July that is problematic for me....

Aw, it's not as flat as you may think. Kansas is flat. Iowa has beautiful rolling hills covered in corn and soybeans with occasional wooded areas. Plus, in many parts of the state there is a road every square mile making for easy recovery of downed payload packages!

Some have said "Is this Heaven?" With the response "No, it's Iowa." Truer words rarely spoken, IMO.

7707. Topic for Discussion During Friday Meeting

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-21 23:59:56 UTC
From: Doug Loughmiller
Topic: 7707 Message: 7707

Hi Everybody,

First of all, I want to wish everyone a safe and enjoyable GPSL 2010. Unfortunately, I won't be able to attend this year. I had a small accident a couple of months back that required surgery to fix so the time and money I had budgeted to attend the GPSL this year was spent getting back on my feet.

A topic that I would like the group to discuss regarding future meetings has to do with the date chosen for the event. I seem to recall that the GPSL used to be held around the 4th of July but was then moved to the end of July. For me, and I know others, there is a hard conflict with the last weekend in July as this is the weekend that the Central States VHF Conference is held and has been for several decades. Given that both events are held somewhere in the Midwest and involves folks with similar interests, I'd like to ask the group to consider selecting another weekend to hold the GPSL. (Possibly the third weekend in July or the first weekend in August)?

In any case, I would appreciate it if some thought would be given to my request. Have fun flying Saturday and I will be "watching" from home via aprs.fi

73,

Doug, W5BL

7708. Re: [GPSL] Hacking the "Spy" cameras for use in balloon payloads. [1 Attachment]

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-22 00:31:22 UTC
From: Bruce Coates
Topic: 7696 Message: 7708

Hi

I see there's a small type-o. The two cameras I make reference to can be found on eBay by searching for:

Chewing Gum Spy
or
MD80 Spy

You also want to stick with the 720x480 models. Both of these are 640x480 images stretched to 720x480 so they a bit distorted but it's not very noticeable. I tried the 1280x960 models and they're terrible because it's just a 640x480 image scaled up.

73, Bruce

----- Original Message -----
From: Bruce Coates

... this a way to hack into the "Mini DV" and "Chewing Gum" "spy" cameras you find on eBay.

7709. Quick question

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-22 01:25:10 UTC
From: Zack Clobes
Topic: 7709 Message: 7709

With the CHDK firmware installed, how do I get it to auto-run my intervalv program? The write-protect is set, and the CHDK itself is auto-starting, just not my basic script.

Zack

7710. WebEx Information for Friday

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-22 03:01:23 UTC
From: Zack Clobes
Topic: 7710 Message: 7710

Below is the WebEx information. The whole thing was put together,
relatively last-minute so all I can say is that I'm hoping for the best.
Please note, we are limited to 25 connected users, therefore we have decided
NOT to publish this for the general public this year.

There are two sessions - an AM and a PM. You will have to disconnect from
the AM during our lunch break, and reconnect in the afternoon.

I will try my best to make this an enjoyable experience for all. If you
have questions or comments during the symposium, the best way to contact me
would probably be via email.

Great Plains Super Launch - 9:00AM (Central)

From: Rick von Glahn
Topic: 7709 Message: 7711

You need to go into the CHDK menu system and set the script to automatically run when the CHDK system boots. I don't have a camera handy so can't tell you exactly how to get to the right menu but as I recall it was pretty easy to find once I knew what I had to do.

That sounds right. Without auto-run, you have to go to the menu key, select
the program and then start it.

To enable autostart , enter Alt mode, access the main menu, then access the Scripts menu. Make sure that your intervalv script is the active script, and look for the Autostart param . Enable autostart , then power down. On the next powerup , the camera will enter play mode, but the script will be running, and will enter record mode when it gets to a record command (e.g. "shoot"). On my A480, the options are Off, Once, and On, and it works great.

With the CHDK firmware installed, how do I get it to auto-run my intervalv program? The write-protect is set, and the CHDK itself is auto-starting, just not my basic script.

Zack

7714. Streaming video for the Saturday launches from GPSL?

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-22 19:57:28 UTC
From: wb8elk@aol.com
Topic: 7714 Message: 7714

I won't be able to attend GPSL....I have recovered from being ill earlier this week but too wiped out to make the 850 mile drive. I looked into airfare, but couldn't find anything reasonable at this late date.

I was wondering if anyone has a cellular enabled netbook that can stream the video of the launches on Saturday?....I can let whoever has this capability use my BATC.TV account info for the stream...just let me know.

I look forward to being there on Friday via Internet virtual reality and am planning to give my talk via Zack's Webex service....it includes a webcam insert.

I will miss being there in person, but at least I can experience it vicariously via the Internet.

Bill,

I'll try and stream the launch. I have my own account so won't need yours. But I'm so sorry to hear you won't be here. I can't imagine a GPSL without you.

Do you have the information about the WebEx of the conference so you can at least look in and keep us honest?

ARBONET's last position was at 14k on the descent. Predictions should place it within about 1 square mile, around highway 56th and 4th, west of McPherson.

Haven't heard from EOSS or ORB.

Traveler's lanyard managed to wrap around the load line, and cut the balloon free at release. We had to re-fill and relaunch. Unfortunately, the drop impact seems to have shut both of our on-board cameras down, and we did not get any photos. APRS worked well otherwise.

Zack Clobes, W0ZC

Topic: 7726 Message: 7726

Thank you all very much for attending, the conversations, the kind words, and the comradery. Crys and I really enjoy this - she said it feels like a family reunion, and I have to agree. Honestly, hosting is a lot of hard work, but I thoroughly enjoy it and wouldn't change a thing.

I will try to get a survey put out in the next few days to solicit some input for future editions.

And speaking of the future, I'm not sure where it's headed over the next couple of years. I've heard Omaha, Pella Iowa, Pueblo (EOSS), and of course I'd love to have you all back *any* time... (actually 2013 is probably bad for me. Is it sad to be planning your life that far out?). I'm going to defer those questions to Paul for now.

Please have a safe trip home, and keep an eye on the weather. I don't anticipate anything too severe tonight, but keep your eyes open.

Zack Clobes, W0ZC

P.S. I'd like to get a central photo sharing site put together, I was thinking maybe Picasa. Does anyone have any recommendations?

7727. Recoveries

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-25 03:37:26 UTC
From: Zack Clobes
Topic: 7727 Message: 7727

For those of you who weren't here, there were two non-recoveries.

ARBONET lost telemetry on their package around burst time, and picked up a few packets at 14k but were never able to hear it again on the ground. A team of Project: Traveler and ORB scoured the area for a couple of hours.

The WL7II-10 flight also had intermittent telemetry up to around 60k. Despite EOSS's best efforts, the telemetry nor the secondary beacons were ever picked up on the ground.

All other flights were successful. Project: Traveler was next-to-last to launch, first to recover, and was feeling so good that we decided to launch again. I think everyone else was pretty well recovered before lunch time.

Zack...thanks for putting together a great GPSL2010 ... even attending through virtual reality it felt just like I was there via that great Webex link. There were over 13 others attending via Webex from around the World. After you changed the WiFi access, it was very smooth with no dropouts...great stuff and I really enjoyed everyone's presentations. If you have a place to upload the PPT's, that would be great as I missed a lot of the EOSS presentation due to the spotty WiFi link during the first two hours. It was great seeing everyone via the streaming video webcams from EOSS and WA0TJT as well. There were about 10 of us watching the launches via Keith WA0TJT's BATC.TV video stream as well on Saturday morning....looked like some exciting inflations with the wind gusts. It was fun watching Kansas get covered up by APRS balloon tracks and chase vehicles. Ron N9QGS also had a DominoEX transmitter on the BASE balloon that was linked to the Spacenear.us/tracker website and that worked well until the final descent when his cell modem hit his upload limit...quite a few were watching there as well.

I'll make every effort to attend GPSL2011 even if I have to build a matter transporter or 3-D hologram projector to do it.

- Bill WB8ELK

Does anyone have a list of the balloons launched and their callsigns and frequencies on each?

Right now we have Pella, IA for 2011 and Omaha, NE for 2012. Nothing is planned for 2013 at this time. I'm amazed that we have GPSL planned this far out. Normally, we wouldn't have decided next year yet.

That being said, 2012 is the 25th anniversary of modern ARHAB. We should make 2012 a special year. I'd like to see a year book with pictures and data from ev ery flight that year.

I'd also like to see us start a FDSL. It wouldn't be located in a singe location like GPSL. But we could coordinate our launches and great special QSL cards for everyone making a contact through a balloon on FD. It would be nice if we could talk to someone ar ARRL about this being a category they recognize. But if they don't want to, then sending out QSL cards that rode into near space may attract enough attention to makes some contacts.

Condolences to both teams from the great State of Texas. Just goes to show
that Ma Nature and Murphy set the bar really high to achieving the perfect
flight.

And congratulations to Zack for not only having surmounted that tall barrier,
but also, and not least" for having assembled a truly memorable GPSL, and
his third to date. Kudos!!

EOSS managed to retain a tenuous grasp on its 100% recovery record, thanks
in a great part to our good friends from days of yore, Mike N0MPM, Harry KC5TRB
and John K5JFD.

I personally Hate Picassa,

Why not use the photo area right here on the group itself,
you can make a main filder GPSL 2010 and stuff all the pic in there or
even make sub folders inside that folder etc. to make sub catagories
Like the presentations,, launches grops etc.

Hi Bill,

and from a fellow Birthday Boy that attended remotely, that was cool!

Again there is a LOT of storage space right here on the groups site.
Please do stuff the PPT files or anything else right here for all.

From: Keith Kaiser
Topic: 7731 Message: 7736

Next time I do this, I'll be sure to put the sun behind me. This is the first time I actually did streaming from outside. I'm surprised at the quality of both the sound and picture.

As it turns out I didn't have to leave so early, we could have stayed and showed the rest of the launches. I feel bad I didn't do that in fact.

Lessons learned are always there and I learned a lot about doing this streaming video thing. Next time it will be better.

Thanks for the video link Bill and thanks for keeping a copy of it Douglas.

Hi all,
Just to say - had a lot of fun with the remote attendance - any chance the presentations were recorded - managed to miss all of them!

Picasa is great for integrating albums into your own websites. It's also a lot better for casual browsing. Just make sure the album is public so no Google signin is required.

As much as I like my new Droid, there's still no substitute for a real keyboard (home ISP still down).

Mark

On Jul 24, 2010 10:17 PM, "Zack Clobes" <zclobes@...> wrote:

Really on the casual browsing?

I found it the opposite to be true.

Now that I'm on DSL it's Ok, but when i was on Dialup, if someone ever sent me to a Picassa page or i should say a link to one, I'd just never ever go because the bandwidth required to look around was soo bad that nothing was ever seen. At least with the yahoo group format everything was small thumbnails and if one image looked interesting, then you could bother to download the large size, but you diddn't have to do them all.

Unless picassa is different now and a dialup person isn't killed like it used to be.

anyone send me a new Picassa site?

I love the yearbook Idea.

Would it be just the GPSL launches, for that year, or all launches from everywhere?

Field Day is a no go for me. while yes I may be one of the original groups, only being a year behind Bill on doing these flights, I have yet been able to go to a GPSL. A few close friends know why. But even if it was possible, every Field Day since 1975 I have actually done "Field Day" ya know the whole 99% HF transmitting thing. it's a Big thing around here. so i'm tied up for sure on that day and all of my chase and recovery teams are also tied up on that weekend. So as far as a FD day launck NSS won't be able to.

Now as Paul says

" But we could coordinate our launches and great special QSL cards for everyone making a contact through a balloon on FD. It would be nice if we could talk to someone ar ARRL about this being a category they recognize. But if they don't want to, then sending out QSL cards that rode into near space may attract enough attention to makes some contacts."

Make some contacts is not a problem.. Well at least on our flights that we open for general public use Like cross band repeaters.

Our last cross band repeater flight 238 QSO's we made through the balloon. Thats not bad. A QSO rate than many contesters would love to have he he he..

As to the Field Day superlaunch....I flew a simplex repeater for 2 of the past 3 Field Days and we had a number of Field Day sites talking through the repeater across the Southeast and lower Midwest...some were 600 miles or more apart. This would be something that we could propose to the ARRL as a special contact event during Field Day, if nothing more than QSL cards. Allowing remote FD sites to talk to each other via the balloon repeater is after all, what Field Day is supposed to be about (that and the great cookouts).

Subject: Re: [GPSL] Thank you all!

Right now we have Pella, IA for 2011 and Omaha, NE for 2012. Nothing is planned for 2013 at this time. I'm amazed that we have GPSL planned this far out. Normally, we wouldn't have decided next year yet.

That being said, 2012 is the 25th anniversary of modern ARHAB. We should make 2012 a special year. I'd like to see a year book with pictures and data from ev ery flight that year.

I'd also like to see us start a FDSL. It wouldn't be located in a singe location like GPSL. But we could coordinate our launches and great special QSL cards for everyone making a contact through a balloon on FD. It would be nice if we could talk to someone ar ARRL about this being a category they recognize. But if they don't want to, then sending out QSL cards that rode into near space may attract enough attention to makes some contacts.

The repeater contacts don't count towards the Field Day points. If an exception could be made for such a special event, then I think there would be a lot more interest.

It seems like a reasonable request, but it should probably be taken up with the ARRL ASAP. I don't see them yet, but I'd image that FD rules will probably be posted by the end of the year.

Not only should we contact ARRL ASAP, someone who belongs to ARRL should contact them. I'm not a member, so I don't think I'd be a good person to contact them.

Is someone in the ARHAB community have a high level contact in ARRL?

As I was saying, if getting ARRL onboard fails, we should be prepared to give FD stations a reason to pay attention. Like QSL cards, SSTV, and ATV from near space. We may not be a part of field day, but we have cookies.

How about AMSAT?

In the beginning 20 years ago, AMSAT was very supportive even to the point of being enthusiastic of our projects.

They commonly thought of our flights as low altitude temporary OSCARS!

Maybe they may have some clout?

Field Day contacts through "Real" Oscar Satellites do count for points. Maybe with AMSATS support someone from AMSAT could contact the League and get contacts made through a balloon to count as a contact with a regular satellite.

Sadly I am not a member of either group so I'm not the one to spearhead this for sure.

Topic: 7726 Message: 7748

I would like to extend my thanks to Zack & Crys for putting together a great GPSL.
It was very enjoyable, entertaining and informative. Thanks again!

Thanks to those who had a hand in getting prizes and magazines.

Thanks to all the attendies for their support of GPSL and for your willingness to share and help others where needed.

I would also like to thank EOSS for their help at the launch site to whom ever need an extra hand or a word of encouragement.

Zack,

On behalf of EOSS let me thank you and Crys for an outstanding GPSL. The EOSS members who were there thought the presentations were educational, had a great flight, enjoyed the group meals and the thought the organization and planning were superb. And the food was exceptional -- you convinced all of us of the quality of the BBQ place you used, and the snacks in the afternoon were all most sinful they were so good. We learned a bunch during the pre-flight preparations at the airport too.

Thank you very much.

Sorry we couldn't find the payload for the group from Texas.

Think you would have no problem at all convincing EOSS to return to Hutch anytime for another GPSL.

73,

Nick

EOSS GPSL Coordinator.

I also want to thank everyone for a great time at the 2010 GPSL. I appreciate that you've always accepted me, even though I'm a nominal ham. Saturday was my first flight that I left the 900 MHz system on the ground and stayed exclusively in the licensed 2-meter band.

As for 2012, I'd like to suggest that we celebrate throughout the year, and encourage input from as many flights as we can, including the growing academic community.

I'd also like to propose a second Superlaunch event on Saturday, August 11,2012 from a site as close as practical to Bill's first launch site near Findlay, Ohio on August 15, 1987. It would be great to have more participants than were able to make the 20th anniversary event.

Zack:

Here's another thanks for setting up the webEx option for those of us who couldn't make it. It was outstanding to be able to "attend" this year! Hopefully I'll be able to make it back to GPSL in person sooner rather than later... we'll see how schedules work out. For now, though, the extra effort is greatly appreciated.

In addition to my ties to ARRL, I am a former AMSAT president and still maintain contact with most of the officers and BoD memebrs. Here again I will be glad to champion discussions with AMSAT as they conduct their own FD activity along with the ARRL event. I would suggest that we start with the ARRL and then after we see what their response is we can contact AMSAT for further support.

How about AMSAT?

In the beginning 20 years ago, AMSAT was very supportive even to the point of being enthusiastic of our projects.

They commonly thought of our flights as low altitude temporary OSCARS!

Maybe they may have some clout?

Field Day contacts through "Real" Oscar Satellites do count for points. Maybe with AMSATS support someone from AMSAT could contact the League and get contacts made through a balloon to count as a contact with a regular satellite.

Sadly I am not a member of either group so I'm not the one to spearhead this for sure.

Not only should we contact ARRL ASAP, someone who belongs to ARRL should contact them. I'm not a member, so I don't think I'd be a good person to contact them.

Is someone in the ARHAB community have a high level contact in ARRL?

As I was saying, if getting ARRL onboard fails, we should be prepared to give FD stations a reason to pay attention. Like QSL cards, SSTV, and ATV from near space. We may not be a part of field day, but we have cookies.

The repeater contacts don't count towards the Field Day points. If an exception could be made for such a special event, then I think there would be a lot more interest.

It seems like a reasonable request, but it should probably be taken up with the ARRL ASAP. I don't see them yet, but I'd image that FD rules will probably be posted by the end of the year.

I love the yearbook Idea.

Would it be just the GPSL launches, for that year, or all launches from everywhere?

Field Day is a no go for me. while yes I may be one of the original groups, only being a year behind Bill on doing these flights, I have yet been able to go to a GPSL. A few close friends know why. But even if it was possible, every Field Day since 1975 I have actually done "Field Day" ya know the whole 99% HF transmitting thing. it's a Big thing around here. so i'm tied up for sure on that day and all of my chase and recovery teams are also tied up on that weekend. So as far as a FD day launck NSS won't be able to.

Now as Paul says

" But we could coordinate our launches and great special QSL cards for everyone making a contact through a balloon on FD. It would be nice if we could talk to someone ar ARRL about this being a category they recognize. But if they don't want to, then sending out QSL cards that rode into near space may attract enough attention to makes some contacts."

Make some contacts is not a problem.. Well at least on our flights that we open for general public use Like cross band repeaters.

Our last cross band repeater flight 238 QSO's we made through the balloon. Thats not bad. A QSO rate than many contesters would love to have he he he..

7755. File Upload Area

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-26 13:33:55 UTC
From: Zack Clobes
Topic: 7755 Message: 7755

I'm still looking for ideas on the file upload... I checked into the GPSL Yahoo Group server, and unless I'm missing something, we only have 100MB of space there. I have almost 500MB of PowerPoints and video. Stripping out the video still leaves very little room for photos.

You might want to look at dropbox.com.

They have a 2GB free account and let you set options to share folders. I haven't tried it but I know a lot of people that really like it.

You might want to take a peek at Google Docs since you're a GMail user already. Only 1 Gb free storage but upgradeable (20 Gb for $5/yr, shareable between other Google storage services). I've only started playing with it, so I don't know if this will require other users to have a Google account to browse them or not.

MS SkyDrive does require a MS Live account signin for access but also has a few Gb of free storage.

Louise and I would like to voice a sincere Thank You! to Zack and Crys and all for all the hard work put into GPSL 2010. This was my second GPSL and Louise's first, and both of us were sincerely appreciative of the major efforts and hospitality for this event! I don't think it could go much better, we had a great time and I was again impressed with the great people involved in this hobby!

Thank you for everything!

Would you want to put some sort of photo gallery script on the server so
that the individual can upload photos themselves? Otherwise, I'm afraid
that you're going to be overwhelmed with pictures, plus we'll run into
mailbox size issues.

7764. ARBONET Package at GPSL

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-26 17:37:35 UTC
From: Michael Willett
Topic: 7764 Message: 7764

Hello all;

Several people thought we flew the light-weight, envelope control package I talked about in the presentation, and no, that one did not go up, we flew a simple camera package for GPSL-2010.

In my desire to have something quick for Louise and I to fly at GPSL, I simply put a Microtrack-300 and a video camera in a package and that is what we flew. I did not have time to get a second beacon going. The Microtrack-300 was extensively tested the week before, in my office, hanging from the basket ball hoop outside, as well as put in the freezer at 0F over-night without missing a beat. The batteries are 19AH Lithium Thionyl Chloride Batteries, (yes 19AH!) so they are good to -60F and I have never seen a temp below 0F inside my packages in flight, so I think the batteries were AOK. No doubt, if the Tracker decided to start up again, it is still putting out packets now and will for a week or more.

I initially thought that somehow I mis-programmed the Microtrack-300 for smart beaconing, but the data history always occurs in the 18th second of each minute, so the smart beaconing thought is not true. I also thought a stronger signal from a few other packages with extra telemetry were stepping on us, but I don't think that was true either. Basically, the Microtrack inexplicably stopped working at times, even though I had performed fairly thorough testing. Frustrating... :)

Saturday several people graciously assisted our small team get in the air and later in searching for the package, and we --Greatly-- appreciated their help. Losing a payload is a bummer, especially when you do it twice in a row at GPSL.... grovel, grovel... :) Saturday night I ran dozens of simulations trying to figure out worst case for a short flight from the data points were we had 99,783 ft, 40Kft, 33Kft, 30Kft, 14Kft and worst case for a long flight and tried to cover those areas Sunday morning until noon. Mark and Carol searched early Sunday morning before heading home, and Louise and I also scoured for four more hours before heading back to Texas. We came up empty. But my simple simulations did not show the area Zack is now proposing. We hit almost every road for about 50 square miles north and south of Hwy 56 and hated to give up!

Sincere Thank You to all that assisted us!

--Michael K5NOT

7765. ORB-26 Recap

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-27 00:46:50 UTC
From: HarryM
Topic: 7765 Message: 7765

ORB-26 Flight Recap

ORB-26 was launched from Hutchinson Municipal Airport at 9:02 am CDT. Ascent was approximately 1000 fpm and reached an altitude of 74,466 ft. After burst the cutdown was initiated to release the balloon remnants and the payloads descended under a full chute to a landing at 10:31 am CDT. Landing site was 19.45 mi. NNE of the launch site (3816.04/-9737.02) and 7.5 mi. SSE of Mcpherson, Kansas. We were in position about 200 yards from landing and saw the chute and payloads make their final descent into a harvested wheat field.

The digital still camera captured 48 pictures. One of which was of another balloon and was close enough to see its chute and payloads.

The digital video camera got no video. I did not push the right sequence of buttons to start the recorder.

Thanks to all at GPSL 2010 for making it a great time from all of us at RoboMO - Jacob, Jerry, Libby, Nick, Mike, and myself

It was great!!

Our groups 1st launch had highest packet on the way up of 62,457 followed by 6 straight packets of "NO FIX" data and our 1st packet on the way down (15 minutes later) was 65,181 our highest good packet...Near Space
We crashed in a horse and mule field ~ 20 or more miles from from our launch site.

Thanks to All and hope to see you in the future,
Carlton Corbitt - KI4NHK

You can go to www.projecttraveler.org and click on the Photo Gallery to see one in Picasa.

Zack

On Sun, Jul 25, 2010 at 11:11 AM, Joe <nss@...> wrote:

Really on the casual browsing?

I found it the opposite to be true.

Now that I'm on DSL it's Ok, but when i was on Dialup, if someoneever sent me to a Picassa page or i should say a link to one, I'd justnever ever go because the bandwidth required to look around was soobad that nothing was ever seen. At least with the yahoo group formateverything was small thumbnails and if one image looked interesting, then you could bother to download the large size, but you diddn't haveto do them all.

Unless picassa is different now and a dialup person isn't killed likeit used to be.

anyone send me a new Picassa site?

Ron,
Thanks for the pics. In the pic labeled "Base 47 on left", that's ORB on the right.

Everyone,
I've posted a pic on the GPSL Forum "pic" area. It's a pic taken from ORB of another balloon in flight. Take a look and see if anyone can identify the group that flew it.

Dear group,

This was my first GPSL, and I want to thank everyone for the warm hospitality in Kansas. I was first introduced to ARHAB with Near Space Science in Wisconsin back I would say it was around 1995-1996 time frame. I was an on-looker then, and was absent from the scene and got back into it from a recovery & tracking aspect in the last 2 to 3 years been active in helping with several groups (WB8ELK with SpacePort Indiana & BASE specifically in the last few years).

Bill's DominoEx package and what has been created with the spacenear.us website is amazing, and Im sorry I had a problem with Verizon to allow the full track to be recorded. They have credited me for the service for that day and I now have a phone number that I can get support on Saturday's.

I want to thank Brian, KC0BS with his rounds to the hotels to get people more familiar with UI-View, I know about 3 times more then I knew the last 2 years. But I may need still need help limiting web traffic in, as I think it killed my Verizon cap early along with a problem they said may have occurred at their end... but these are things we work out.

I think we last mentioned Pella, IA for 2011, I will get it marked on the calendar once a date is set, I think their will be a huge welcoming in this community. maybe we can make it on their calendar of events.

Thanks to BASE for the invite, and I enjoyed meeting Paul in helping with his Recovery, and the presentation, food, all excellent.

Thanks Again,
Ron N9QGS

--- In GPSL@yahoogroups.com, wb8elk@... wrote:
. Ron N9QGS also had a DominoEX transmitter on the BASE balloon that was linked to the Spacenear.us/tracker website and that worked well until the final descent when his cell modem hit his upload limit...quite a few were watching there as well.

7774. NearSys Report

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-27 05:03:51 UTC
From: L. Paul Verhage
Topic: 7774 Message: 7774

I've uploaded my files from the GPSL flight on my website at,
http://nearsys.com/arhab/flightdata/2010/c/index.htm

The only thng that went wrong is I accidentally shu off the video camera.
Rats!

Thanks everyone for helping with my 80th mission.

Carlton and the RoboMO group,

It has been great fun watching you and your group progress over the past three years. Congratulations on your first flight and we at EOSS wish you many more of these fun adventures. Good luck with rovers!

- Marty, EOSS

Subject: Re: [GPSL] Thank you all!

Thanks to all at GPSL 2010 for making it a great time from all of us at RoboMO - Jacob, Jerry, Libby, Nick, Mike, and myself

It was great!!

Our groups 1st launch had highest packet on the way up of 62,457 followed by 6 straight packets of "NO FIX" data and our 1st packet on the way down (15 minutes later) was 65,181 our highest good packet...Near Space

We crashed in a horse and mule field ~ 20 or more miles from from our launch site.

Thanks to All and hope to see you in the future,

Carlton Corbitt - KI4NHK

Really on the casual browsing?

I found it the opposite to be true.

Now that I'm on DSL it's Ok, but when i was on Dialup, if someone ever sent me to a Picassa page or i should say a link to one, I'd just never ever go because the bandwidth required to look around was soo bad that nothing was ever seen. At least with the yahoo group format everything was small thumbnails and if one image looked interesting, then you could bother

to download the large size, but you diddn't have to do them all.

Unless picassa is different now and a dialup person isn't killed like it used to be.

anyone send me a new Picassa site?

The NSV on-line flight prediction page appears to be down due to unknown issues at the NOAA. As you know they have a tendency to change things and we have to play a game of hide-and-seek to fix it again.
Anyway, its down at the moment I'll try and keep an eye on it and let everyone know when it comes back.

Thanks for your understanding....

Harry,
I am pretty sure that this is the BASE47 (W9YJ-11) flight string. It has the right number of components, a Kaymont balloon. We launched at the same time and we were flying a little below you for most of your flight (based on aprs.fi data). For example:
at 14:40 UTC ORB was over Arapaho Road just east of 11th Ave. at 46 kft and BASE 47 was on 11th Ave about 1/3 mile south of Arapaho Rd.
at 14:41 UTC both balloons were inside the same mile square, with ORB at 48 kft and BASE 47 at 46 kft
at 14:42 UTC both balloons were just south of Arrowhead Road between 11th and 12th Avenues. ORB was at 49 kft and BASE 47 was at 47 kft.
The last two time markers could give the proper illumination on the Kaymont balloon for the angle between the two.
If you know the time stamp for your photo, I should be able to match the altitudes and separation distances between the two balloons.

Howard,

Can you provide lat/lon data? I think you're on the right track. With Google Earth you can probably simulate the perspective and see if that matches Harry's photo.

Cool photo getting another balloon in-flight as more than a pinprick.

Mark,
I'm tied up for the next day or so. What I did was use aprs.fi in two different browser tabs. I looked up the activity for W9YJ-11 and KC5TRB-11 for July 24. The lat/lon are found with the cursor moving over the points. Unfortunately, the i-gate on 144.34 missed a good part of the first portion of the ORB flight. It is possible that the picture came from a lower altitude. However, it was fortunate that W9YJ-11 beaconed on the 52 second past each minute which nearly perfectly lined up with half of the KC5TRB-11 beacon reports.

I'm attaching a text file with the W9YJ-11 data, perhaps someone else has the data for KC5TRB-11.

I've also overlaid the aprs.fi kml files for the two flights. Later in the flight, I believe that the sun angle doesn't match the image.

7787. Fugo Balloons

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-27 23:12:39 UTC
From: Keith Kaiser
Topic: 7787 Message: 7787

I just watched with fascination a 2005, PBS documentary about the Japanese fugo balloons launched during World War II. It's called 'On and Wind and a Prayer' it shows using actual footage and CGI reenactment the use of these pretty much unknown bomb delivery devices. It talks and shows how the balloons, its package and ballast system were built and designed. It is hard to believe that 60 years ago, some of the very things we do today were already being done. In fact the video also talks about how balloons were used in 1845 in Venice for the same purpose.

The video is available from NetFlix usually with a short wait and last only 60 minutes. Most public libraries also carry a copy or two. I recommend that everyone interested in the hobby of high altitude ballooning take a few minutes and watch this fascinating show. I'm not sure I learned how to design a balloon to cross the Pacific (Atlantic?) so much as that it can be done. Makes me want to try for a Atlantic crossing, anyone still working on this project from a couple of years ago?

Tony,
I'm the one that announced the August flight. I messed up the listing on the ARHAB site and still haven't gotten it corrected.

BASE (DePauw) will be launching a cross band repeater from Rantoul, Illinois on Saturday, August 7 as part of a Boy Scout event, SpaceJam 4. Launch will be approximately 8:30 am Central Daylight Time. I hope to park the balloon above 70 kft for a couple of hours and descend slowly on the balloon after that time. The cross band will use 144.340 MHz as the uplink and 446.025 MHz as the downlink.
We will have a separate balloon carrying NTSC ATV on 439.25 MHz.
Both balloons will be transmitting APRS and DominoEX.

Hi Keith,

The Japanese knew a LOT more about stratospheric winds in WW2 than the US did.
In fact, one of the early B-29 bomb raids on the mainland got all screwed up
when they observed over 300 kt ground speed - way faster than a B-29 could
fly. The honchos back at the base refused to believe the B-N who reported
those winds!

But we eventually figgered it out.

BTW, one of those fugo balloons landed just a mile or so N of our winter
launch site near Ft Collins CO.

Subject: [GPSL] Fugo Balloons

I just watched with fascination a 2005, PBS documentary about the Japanese fugo balloons launched during World War II. It's called 'On and Wind and a Prayer' it shows using actual footage and CGI reenactment the use of these pretty much unknown bomb delivery devices. It talks and shows how the balloons, its package and ballast system were built and designed. It is hard to believe that 60 years ago, some of the very things we do today were already being done. In fact the video also talks about how balloons were used in 1845 in Venice for the same purpose.

The video is available from NetFlix usually with a short wait and last only 60 minutes. Most public libraries also carry a copy or two. I recommend that everyone interested in the hobby of high altitude ballooning take a few minutes and watch this fascinating show. I'm not sure I learned how to design a balloon to cross the Pacific (Atlantic?) so much as that it can be done. Makes me want to try for a Atlantic crossing, anyone still working on this project from a couple of years ago?

Hey Keith,

The AtlanticHalo team are still working towards a launch - taking its time though! - Perhaps launch this winter.

Zack,
Nick Stich, K0NMS-11 was the first to go airborne. The first APRS packet was at 8:37:37 am CDT at an altitude of 5340 ft ASL. Nick's ascent rate near the surface was about 1000 ft/min. I'd guess his release was about 8:34 am.

Dear all,
As a veteran of a very slow climb, I've been thinking about the metal box that landed and attracted the sheriff's department.

Could it be Jerome's flight? When I did the prediction for 1000 ft/min ascent, floating for 50 minutes and descending at 500 ft/min for Saturday, my landing spot was just east of Abilene. I recall some observers that thought that Jerome's ascent rate was quite slow. A very slow ascent with normal descent could easily put a payload into Riley County (it is on the same heading as the rest of the flights).
I hope someone will follow up with the authorities.

I should have mentioned it wasn't local but she thought somewhere in KS.

Umm, we did GPSL launches in Hutchinson this weekend, but the flights only went some 20 miles to McPherson.

Some of you were commenting on my use of outdoor flash during the group photo. Attached are two photos (not my best, but they were back-to-back with and without flash) that were cropped.

Exposure was not the same between the two, but I think it's fairly obvious that the fill flash was somewhat effective at filling in the shadows.

Zack

7808. Field Day Super Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-28 18:05:00 UTC
From: Mike Manes
Topic: 4708 Message: 7808

Hi Jeff,

Amateur Radio on High Altitude Balloons (ARHAB) has grown quite rapidly in the past 10 years, so, unlike some of the ham radio specialties like microwaves, its popularity hasn't been noticed by the general ham population.

One index of ARHAB's growth might be the attendance at the 10th annual Great Plains Super Launch in Hutchinson KS last weekend, which brought in some 60 attendees from 13 different groups around the US, two of which conducted their maiden launches last Saturday morning.

Probably the most comprehensive on-line source of ARHAB stats is at

http://www.arhab.org/

Clicking on the ARHABlinks button reveals that there are at least 82 balloon groups in the world who have signed up on that web site, with some 70 in the US and Canada and the rest flying internationally. And I know that this list is incomplete, since there are some groups I've heard from that don't appear on that list.

Quite a departure from the handful of groups that were active when EOSS started up barely 20 years ago.

Note that a good number of these groups are associated with colleges which serve as Elmers for bringing new hams into hobby. EOSS itself has fostered quite a few new hams.

So what draws hams to this new specialty? It's hard to say - for some, myself included, it's the kick I get seeing students cheer upon seeing their experiments soar skyward towards the edge of space, and their enthusiasm upon seeing them return to earth. For others, it's the thrill of a flying foxhunt. One middle school teacher that EOSS flew for back in its salad days tagged it "The Poor Man's Space Program".

Bill Brown WB8ELK, honored as the grandpa of ARHAB with his pioneering flight in 1987, was inspired by the USAF and NASA manned high altitude flights in the '60's and hoped to experience what Capt. Joe Kittenger, N4HDP, did when he bailed out from 103,000 ft - but only vicariously via his ATV payload. Mike Morgan, N0MPM, put it quite well in observing that ARHAB crams more different aspects of ham radio into a single event than any other - homebrewed payloads, field operations from portable sites, directed nets, APRS tracking, DFing to the landing site, orienteering and multiband, multimode mobile operations, meterology, atmospheric physics and conducting some real science - not to mention Elmering. Paul Verhage KD4STH, who created the first GPSL event, has even written a how-to book available online at www.parallax.com.

Now lets get to the ARHAB-borne repeater question: Most ARHAB flights reach at least 90,000 ft MSL before bursting. The radio horizon from that altitude is about 400 statute miles, thus enabling stations 800 miles apart to QSO. And it's been done! The 2-way "EBE" QSO record is held by ANSR's crossband repeater, where a ham in Los Angeles CA worked another in Las Cruces NM. Prior to that, EOSS held that record with a QSO between Garden City KS and Riverton WY - some 380 miles with just 180 mW ERP from the balloon 2m downlink. Two groups have even managed an "EBBE" QSO, using linked repeaters on separate balloons.

Speaking of DX, one tempting goal that's evaded achievement so far is a trans-Atlantic flight. But one group almost made it, launching from the east coast and landing two days later just a few hundred miles from Ireland. See the records page:

http://www.arhab.org/ARHABrecords.htm

Although ARHAB can be conducted by solo hams, it's usually a group effort amongst several hams who specialize in designing and building payloads (No, Dorothy, there's no Payloads 'R Us), writing and running trajectory and real-time tracking and reporting software, preparing and launching flight strings, teaching student groups, working with the FAA, etc. EOSS, e.g., has some 40 paid-up members, and about 14 of us convoyed to GPSL 2010 last week. My guess is that the typical balloon group has 5 active members, making for about 410 hams doing ARHAB regularly.

But that's not the point of the Field Day Super Launch idea. It wouldn't be an activity limited to ARHAB hams, just the same as Oscar ops aren't limited to AMSAT members. The FDSL repeaters would be open to any FD station, just like orbital satellites are today. The only difference is altitude and terrestrial footprint. And it doesn't take a fancy az-el array to work thru a balloon repeater; why, I QSOed a guy in KS from our launch site in N Colo using just my HT! It is written: "Line of sight is a magic thing."

All we're asking is just a piece of the consideration given satellite QSOs for FD. Real time GPS-based APRS reports of lat/lon and altitude are de riguer for all ARHAB flights nowadays - not DF triangulation and baro pressure telemetry like back in the salad days. So the FL300+ restriction can be validated in real time.

So, there's my pitch to the choir. Hope you can QNQ it to HQ, Jeff.

7809. Re: [GPSL] Field Day Super Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-28 18:16:52 UTC
From: L. Paul Verhage
Topic: 4708 Message: 7809

Very good letter. Thanks for writing this.

If we don't get support, can we do it alone? Gioving NS QSL cards might be
the carrot to get FD stations involved.

Paul

7810. Re: [GPSL] Field Day Super Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-28 18:42:59 UTC
From: Mark Conner
Topic: 4708 Message: 7810

Even without points, I think it'd be fun for the FD ops to play with crossband or simplex repeaters on their handhelds at Sunday morning's breakfast. I think the key is getting the word out well in advance, possibly standardizing some frequencies and launch times and getting details posted to a dedicated, easy-to-use website.

Wow, BZZZ he he he, Brings back memories! Our very first launch was neutral bouyant at 15 feet! it was just out or reach, we chased it for about 1/2 a mile then it crashed into a Barn! it finally got low enough to grab. and we added more gas and it left. But nothing is more frustrating than a payload floating at 10 to 15 feet drifting downwind on a almost dead calm day. it took like ten minutes to go that 1/2 mile as we are all jumping under it trying to grab it!

Ahh yes there's a video somewhere of me chasing a payload bouncing across a mudfield bouncing across the ground just inches from me in a stiff breeze, heading right for the interstate at the edge of the field. I eventually leaped and landed face first on it. One of the early UTARC Icarus flights, UX-7 probably. The problem came from grabbing the wrong size latex balloon, we had pre-calculated the helium lift force on paper.

Thanks, Roger,

I kinda thought that Jeff might be a good foil for this request.
He's a private pilot, and he's served as "Air 1" for our trackers
on a couple of flights.

I've been pretty disappointed on the coverage that ARHAB gets in QST,
compared to some of the other sub-specialties, e.g. microwave. Maybe
this will grab a bit of attention back in Newington ...

Subject: [GPSL] Field Day Super Launch

Hi Jeff,

Amateur Radio on High Altitude Balloons (ARHAB) has grown quite rapidly in the past 10 years, so, unlike some of the ham radio specialties like microwaves, its popularity hasn't been noticed by the general ham population.

One index of ARHAB's growth might be the attendance at the 10th annual Great Plains Super Launch in Hutchinson KS last weekend, which brought in some 60 attendees from 13 different groups around the US, two of which conducted their maiden launches last Saturday morning.

Probably the most comprehensive on-line source of ARHAB stats is at

http://www.arhab.org/

Clicking on the ARHABlinks button reveals that there are at least 82 balloon groups in the world who have signed up on that web site, with some 70 in the US and Canada and the rest flying internationally. And I know that this list is incomplete, since there are some groups I've heard from that don't appear on that list.

Quite a departure from the handful of groups that were active when EOSS started up barely 20 years ago.

Note that a good number of these groups are associated with colleges which serve as Elmers for bringing new hams into hobby. EOSS itself has fostered quite a few new hams.

So what draws hams to this new specialty? It's hard to say - for some, myself
included, it's the kick I get seeing students cheer upon seeing their experiments soar skyward towards the edge of space, and their enthusiasm upon
seeing them return to earth. For others, it's the thrill of a flying foxhunt.
One middle school teacher that EOSS flew for back in its salad days tagged

it
"The Poor Man's Space Program".

Bill Brown WB8ELK, honored as the grandpa of ARHAB with his pioneering flight
in 1987, was inspired by the USAF and NASA manned high altitude flights in the
'60's and hoped to experience what Capt. Joe Kittenger, N4HDP, did when he bailed out from 103,000 ft - but only vicariously via his ATV payload. Mike Morgan, N0MPM, put it quite well in observing that ARHAB crams more different
aspects of ham radio into a single event than any other - homebrewed payloads,
field operations from portable sites, directed nets, APRS tracking, DFing to the landing site, orienteering and multiband, multimode mobile operations, meterology, atmospheric physics and conducting some real science - not to mention Elmering. Paul Verhage KD4STH, who created the first GPSL event, has even written a how-to book available online at www.parallax.com.

Now lets get to the ARHAB-borne repeater question: Most ARHAB flights reach at least 90,000 ft MSL before bursting. The radio horizon from that altitude
is about 400 statute miles, thus enabling stations 800 miles apart to QSO. And it's been done! The 2-way "EBE" QSO record is held by ANSR's crossband repeater, where a ham in Los Angeles CA worked another in Las Cruces NM. Prior
to that, EOSS held that record with a QSO between Garden City KS and Riverton
WY - some 380 miles with just 180 mW ERP from the balloon 2m downlink. Two groups have even managed an "EBBE" QSO, using linked repeaters on separate balloons.

Speaking of DX, one tempting goal that's evaded achievement so far is a trans-
Atlantic flight. But one group almost made it, launching from the east coast and landing two days later just a few hundred miles from Ireland. See the records page:

http://www.arhab.org/ARHABrecords.htm

Although ARHAB can be conducted by solo hams, it's usually a group effort amongst several hams who specialize in designing and building payloads (No, Dorothy, there's no Payloads 'R Us), writing and running trajectory and real-time tracking and reporting software, preparing and launching flight strings, teaching student groups, working with the FAA, etc. EOSS, e.g., has some 40 paid-up members, and about 14 of us convoyed to GPSL 2010 last week. My guess is that the typical balloon group has 5 active members, making for about 410 hams doing ARHAB regularly.

But that's not the point of the Field Day Super Launch idea. It wouldn't be an activity limited to ARHAB hams, just the same as Oscar ops aren't limited to AMSAT members. The FDSL repeaters would be open to any FD

station, just like orbital satellites are today. The only difference is altitude and terrestrial footprint. And it doesn't take a fancy az-el array to work thru a balloon repeater; why, I QSOed a guy in KS from our launch site in N Colo using just my HT! It is written: "Line of sight is a magic thing."

All we're asking is just a piece of the consideration given satellite QSOs for FD. Real time GPS-based APRS reports of lat/lon and altitude are de riguer for all ARHAB flights nowadays - not DF triangulation and baro pressure telemetry like back in the salad days. So the FL300+ restriction can be validated in real time.

So, there's my pitch to the choir. Hope you can QNQ it to HQ, Jeff.

Topic: 7817 Message: 7817

Hi All, I've gotten my rig here in Louisville, KY onto Globaltuners.com.

http://www.globaltuners.com/receiver.php?receiver=658

It's there primarily for balloon telemetry use. Feel free to ask anyone on there to let you have control if you have a balloon to listen to. I've made it clear on the radio page that balloons take priority. Also I may try to get DL-FLDIGI running on there directly when someone gets the remote interface to DL-FLDIGI completed.

Thanks,
Dan

Mike,

Excellent writeup....the ARRL could use that as it stands for an ARHAB article in QST. I will have to say that in the two Field Day events that I flew a repeater that I received many excited emails from a number of Field Day sites in over eight states who had a blast working other Field Day sites via the balloon repeater. Plus many were able to access it with just a mobile rig and some even with a rubber duck from hundreds of miles away from the balloon. I know that the attendees at my local Huntsville, AL Field Day site were amazed to hear me talking to Field Day sites in Illinois, Indiana and Ohio with my 2m handheld. The thrill of working through a satellite without the need for an Az/El tracking array.

Since the BalloonSat is essentially a low altitude satellite, I would think that the same rules for contacts made via satellites could apply to a BalloonSat for Field Day. If nothing else, there is often special points for a mode....in past years, extra points were given for an ATV demo for example. I also have a few contacts in the ARRL and will send them an email as well about this possibility.

Subject: Re: [GPSL] Field Day Super Launch

Thanks, Roger,
I kinda thought that Jeff might be a good foil for this request.
e's a private pilot, and he's served as "Air 1" for our trackers
n a couple of flights.
I've been pretty disappointed on the coverage that ARHAB gets in QST,
ompared to some of the other sub-specialties, e.g. microwave. Maybe
his will grab a bit of attention back in Newington ...

<mailto:mrmanes@...>> wrote:

Hi Jeff,

Amateur Radio on High Altitude Balloons (ARHAB) has grown quite rapidly
in the past 10 years, so, unlike some of the ham radio specialties like

microwaves, its popularity hasn't been noticed by the general ham
opulation.

One index of ARHAB's growth might be the attendance at the 10th annual
reat
Plains Super Launch in Hutchinson KS last weekend, which brought in some
0
attendees from 13 different groups around the US, two of which conducted
their maiden launches last Saturday morning.

Probably the most comprehensive on-line source of ARHAB stats is at

http://www.arhab.org/

Clicking on the ARHABlinks button reveals that there are at least 82
balloon groups in the world who have signed up on that web site, with
some 70 in the US and Canada and the rest flying internationally. And
I know that this list is incomplete, since there are some groups I've
heard from that don't appear on that list.

Quite a departure from the handful of groups that were active when EOSS
started up barely 20 years ago.

Note that a good number of these groups are associated with colleges which
serve as Elmers for bringing new hams into hobby. EOSS itself has
ostered
quite a few new hams.

So what draws hams to this new specialty? It's hard to say - for some,
yself
included, it's the kick I get seeing students cheer upon seeing their
experiments soar skyward towards the edge of space, and their enthusiasm
pon
seeing them return to earth. For others, it's the thrill of a flying
oxhunt.
One middle school teacher that EOSS flew for back in its salad days tagged
t
"The Poor Man's Space Program".

Bill Brown WB8ELK, honored as the grandpa of ARHAB with his pioneering
light
in 1987, was inspired by the USAF and NASA manned high altitude flights in
he
'60's and hoped to experience what Capt. Joe Kittenger, N4HDP, did when he
bailed out from 103,000 ft - but only vicariously via his ATV payload.
ike
Morgan, N0MPM, put it quite well in observing that ARHAB crams more
ifferent
aspects of ham radio into a single event than any other - homebrewed
ayloads,
field operations from portable sites, directed nets, APRS tracking, DFing
o

the landing site, orienteering and multiband, multimode mobile operations, meterology, atmospheric physics and conducting some real science - not to mention Elmering. Paul Verhage KD4STH, who created the first GPSL event, as
even written a how-to book available online at www.parallax.com <http://www.parallax.com>.

Now lets get to the ARHAB-borne repeater question: Most ARHAB flights each
at least 90,000 ft MSL before bursting. The radio horizon from that ltitude
is about 400 statute miles, thus enabling stations 800 miles apart to QSO. And it's been done! The 2-way "EBE" QSO record is held by ANSR's rossband
repeater, where a ham in Los Angeles CA worked another in Las Cruces NM. rior
to that, EOSS held that record with a QSO between Garden City KS and iverton
WY - some 380 miles with just 180 mW ERP from the balloon 2m downlink. Two groups have even managed an "EBBE" QSO, using linked repeaters on separate balloons.

Speaking of DX, one tempting goal that's evaded achievement so far is a rans-
Atlantic flight. But one group almost made it, launching from the east oast
and landing two days later just a few hundred miles from Ireland. See the records page:

http://www.arhab.org/ARHABrecords.htm

Although ARHAB can be conducted by solo hams, it's usually a group effort amongst several hams who specialize in designing and building payloads No,
Dorothy, there's no Payloads 'R Us), writing and running trajectory and real-time tracking and reporting software, preparing and launching flight strings, teaching student groups, working with the FAA, etc. EOSS, e.g., has some 40 paid-up members, and about 14 of us convoyed to GPSL 2010 last week. My guess is that the typical balloon group has 5 active members, making for about 410 hams doing ARHAB regularly.

But that's not the point of the Field Day Super Launch idea. It wouldn't be an activity limited to ARHAB hams, just the same as Oscar ops aren't limited to AMSAT members. The FDSL repeaters would be open to any FD station, just like orbital satellites are today. The only difference is altitude and terrestrial footprint. And it doesn't take a fancy az-el array to work thru a balloon repeater; why, I QSOed a guy in KS from our launch site in N Colo using just my HT! It is written: "Line of sight is a magic thing."

All we're asking is just a piece of the consideration given satellite QSOs for FD. Real time GPS-based APRS reports of lat/lon and altitude

are de riguer for all ARHAB flights nowadays - not DF triangulation and baro pressure telemetry like back in the salad days. So the FL300+ restriction can be validated in real time.

So, there's my pitch to the choir. Hope you can QNQ it to HQ, Jeff.

Subject: [GPSL] Field Day Super Launch

Hi Jeff,
Amateur Radio on High Altitude Balloons (ARHAB) has grown quite rapidly
n the past 10 years, so, unlike some of the ham radio specialties like
icrowaves, its popularity hasn't been noticed by the general ham population.
One index of ARHAB's growth might be the attendance at the 10th annual Great
lains Super Launch in Hutchinson KS last weekend, which brought in some 60
ttendees from 13 different groups around the US, two of which conducted
heir maiden launches last Saturday morning.
Probably the most comprehensive on-line source of ARHAB stats is at
http://www.arhab.org/
Clicking on the ARHABlinks button reveals that there are at least 82
alloon groups in the world who have signed up on that web site, with
ome 70 in the US and Canada and the rest flying internationally. And
know that this list is incomplete, since there are some groups I've
eard from that don't appear on that list.
Quite a departure from the handful of groups that were active when EOSS
tarted up barely 20 years ago.
Note that a good number of these groups are associated with colleges which
erve as Elmers for bringing new hams into hobby. EOSS itself has fostered
uite a few new hams.
So what draws hams to this new specialty? It's hard to say - for some, myself
ncluded, it's the kick I get seeing students cheer upon seeing their
xperiments soar skyward towards the edge of space, and their enthusiasm upon
eeing them return to earth. For others, it's the thrill of a flying foxhunt.
ne middle school teacher that EOSS flew for back in its salad days tagged it
The Poor Man's Space Program".
Bill Brown WB8ELK, honored as the grandpa of ARHAB with his pioneering flight
n 1987, was inspired by the USAF and NASA manned high altitude flights in the
60's and hoped to experience what Capt. Joe Kittenger, N4HDP, did when he
ailed out from 103,000 ft - but only vicariously via his ATV payload. Mike
organ, N0MPM, put it quite well in observing that ARHAB crams more different
spects of ham radio into a single event than any other - homebrewed payloads,
ield operations from portable sites, directed nets, APRS tracking, DFing to

he landing site, orienteering and multiband, multimode mobile operations,
eterology, atmospheric physics and conducting some real science - not to
ention Elmering. Paul Verhage KD4STH, who created the first GPSL event, has
ven written a how-to book available online at www.parallax.com.
Now lets get to the ARHAB-borne repeater question: Most ARHAB flights reach
t least 90,000 ft MSL before bursting. The radio horizon from that altitude
s about 400 statute miles, thus enabling stations 800 miles apart to QSO.
nd it's been done! The 2-way "EBE" QSO record is held by ANSR's crossband
epeater, where a ham in Los Angeles CA worked another in Las Cruces NM. Prior
o that, EOSS held that record with a QSO between Garden City KS and Riverton
Y - some 380 miles with just 180 mW ERP from the balloon 2m downlink. Two
roups have even managed an "EBBE" QSO, using linked repeaters on separate
alloons.
Speaking of DX, one tempting goal that's evaded achievement so far is a trans-
tlantic flight. But one group almost made it, launching from the east coast
nd landing two days later just a few hundred miles from Ireland. See the
ecords page:
http://www.arhab.org/ARHABrecords.htm
Although ARHAB can be conducted by solo hams, it's usually a group effort
mongst several hams who specialize in designing and building payloads (No,
orothy, there's no Payloads 'R Us), writing and running trajectory and
eal-time tracking and reporting software, preparing and launching flight
trings, teaching student groups, working with the FAA, etc. EOSS, e.g.,
as some 40 paid-up members, and about 14 of us convoyed to GPSL 2010 last
eek. My guess is that the typical balloon group has 5 active members,
aking for about 410 hams doing ARHAB regularly.
But that's not the point of the Field Day Super Launch idea. It wouldn't
e an activity limited to ARHAB hams, just the same as Oscar ops aren't
imited to AMSAT members. The FDSL repeaters would be open to any FD
tation, just like orbital satellites are today. The only difference is
ltitude and terrestrial footprint. And it doesn't take a fancy az-el
rray to work thru a balloon repeater; why, I QSOed a guy in KS from our
aunch site in N Colo using just my HT! It is written: "Line of sight
s a magic thing."
All we're asking is just a piece of the consideration given satellite
SOs for FD. Real time GPS-based APRS reports of lat/lon and altitude
re de riguer for all ARHAB flights nowadays - not DF triangulation and
aro pressure telemetry like back in the salad days. So the FL300+
estriction can be validated in real time.
So, there's my pitch to the choir. Hope you can QNQ it to HQ, Jeff.

7820. Re: [GPSL] Field Day Super Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-29 00:02:37 UTC
From: Mike Manes
Topic: 4708 Message: 7820

Thanks, Tony,

As the thread indicates, it was sent to Jeff K0RM, the ARRL Colo Section Mgr, who has actively supported EOSS over the years. He's taking the FDSL idea to the contest honchos at HQ.

Maybe it'll elevate some interest up there so we can get some publicity in QST?

Thanks, Bill,

That means a lot coming from the grand-daddy of ARHAB!

I've cc'ed Jeff K0RM, who may be interested in your experiences with
previous FD repeater flights.

Yipes! The sound of 60 Hz HV arcing sends shivers up this old spine!
EOSS has landed across power lines 3 times, but only one of 'em produced
any damage:

http://www.eoss.org/eoss090/eoss090_k0jlz_touch_ex.wmv

There was NOTHING salvageable from that poor, little DF beacon - not
even the BNC antenna connector :=(.

Out of curiosity, has anyone tried balloon to balloon contact at a distance? If you could coordinate the launch you might be able to hop several balloons @ 5-600 miles between balloons.

Here's a pic from ORB looking at the BASE-47 balloon with Cheney Lake in the background.

ORB was taking a pic every 30 sec, the first 8 were on the ground and this was the 47th pic. That would put it @ 19 min into the flight & ORB was @ 21k-22k ft. at that time.

It takes some careful frequency coordination to prevent creating a huge
stratospheric audio oscillator.

Hi Jerry,

I've done a 400 mile path between balloons...was able to hear Chuck Crist's Wintrax balloon in Indiana back in the early 90's from a balloon I flew with a repeater here in Alabama.

Agree to that Mike....the one I did with Chuck W9IHS in the early 90's was one way only....I was listening to his balloon on 2m and repeating it down on 70cm....it was weak copy and only could hear briefly as we were a bit off in launch timing.

7833. Re: [GPSL] Multi-balloon networks

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-29 10:40:38 UTC
From: BASE
Topic: 4708 Message: 7833

BASE has participated in three balloon to balloon mesh network communication flights. However, they all involved the 900 MHz frequency domain. BASE 1 linked with a Taylor flight in November 2006 over a distance of about 70 miles. In November 2007, BASE 16 was in the first HALO project flew with support from Indiana Space Grant. Our balloon was linked to balloons from Taylor, Valparaiso, and Cedarville universities, covering all of Indiana and some of Ohio and Illinois. Iowa State, Minnesota, and the College of St. Catherines (MN) completed a second network over their home states, but the two networks did not talk to each other. Finally, on April 4, 2009, on BASE 35, we were in the second HALO project that involved 15 simultaneous flights. (Participating schools were: Ball State (IN), Bryan College(TN), Cedarville (OH), College of St. Catherine(MN), DePaul (IL), DePauw (IN), Iowa State, Medgar Evers College (NY), Minnesota, Norfolk State (VA), University of Southern Indiana, Taylor (IN), Temple (PA), Valparaiso (IN), and Wisconsin). Ball State had communications issues and the network failed to stretch to Virginia and Tennessee, Medgar Evers and Temple on connected with each other, but data was exchanged between multiple balloons across the mesh and data was relayed via the balloons to the primary ground station at Taylor in Upland, Indiana.

Agree to that Mike....the one I did with Chuck W9IHS in the early 90's was one way only....I was listening to his balloon on 2m and repeating it down on 70cm....it was weak copy and only could hear briefly as we were a bit off in launch timing.

I guess I was thinking more along the lines of digital packets. Set something up similar to a Zigbee mesh network between balloons. We could call it SkyNet...

Getting launch times and ascent rates coordinated. Maybe just a simple zigbee connection between balloons at GPSL would be a better place to start.

Okay, so GPSL in 2011 is in Colorado. Omaha is interested in either 2012 or 2013. Pella, do you have a preference?

Keith, can we get this up on the website?

Thanks,
Paul

Our contact in Pella will be teaching in 2011. so we'll move them and Omaha
to 2012 and 2013.

Isn't it wonderful to be planing this far in advance?

7842. Re: [GPSL] Field Day Super Launch

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-29 17:58:01 UTC
From: BASE
Topic: 4708 Message: 7842

BASE (DePauw) has participated in three mesh networks with digital packets exchange in the 900 MHz spread spectrum band.
November 2006 - BASE and Taylor over about 70 milesNovember 2007 - Cedarville(OH), College of St. Catherine's(MN), DePauw(IN), Iowa State, Minnesota, Taylor(IN), and Valparaiso(IN). Eastern set (Cedarville, DePauw, Valpo, Taylor) connected but western set did not connect to the east.
April 2009 - Ball State (IN), Bryan College (TN), Cedarville (OH), College of St. Catherine's(MN), DePaul(IL), DePauw(IN), Iowa State, Medgar Evers College(NY), Minnesota, Norfolk State(VA), University of Southern Indiana, Taylor(IN), Temple(PA), Valparaiso(IN), and Wisconsin. Ball State had equipment issues. Bryan and Norfolk State didn't hit any other balloons. Medgar Evers and Temple didn't reach the rest of the network. The other balloons did mesh and all data was downlinked to Taylor's ground station.

I guess I was thinking more along the lines of digital packets. Set something up similar to a Zigbee mesh network between balloons. We could call it SkyNet...

Getting launch times and ascent rates coordinated. Maybe just a simple zigbee connection between balloons at GPSL would be a better place to start.

Agree to that Mike....the one I did with Chuck W9IHS in the early 90's was one way only....I was listening to his balloon on 2m and repeating it down on 70cm....it was weak copy and only could hear briefly as we were a bit off in launch timing.

Jerry....the Digi (formerly Maxstream) XBee PRO XSC modules on 915 MHz with 100 milliwatt outputs would make that possible at the seperation distances that we typically see at GPSL. I'll plan on doing that with a couple of other groups at the next GPSL...I already have the capability to output to the XBee PRO on my multi-mode transmitter and will shortly have the ability to have it show up on a Google Map at the SpaceNear.us website. I'll be doing some range testing of these inexpensive modules at the upcoming Spaceport Indiana flight on August 6th and possibly on the BASE flight on Aug. 7th.

I'm using XBee for a robot communication project. Even the low power ones
are great. I've created a terminal that allows you to command a robot over
a wireless link. It's just like sending serial data over a cable. I'll
have to look into the higher power ones. I'd like to let students try to
recieve data from their BalloonSats.

Bill,
Not sure if you are interested but I have been playing with this tool called GooPs (http://goopstechnologies.com/). In it's simplest form it allows you to track multiple objects real time in Google Earth. It also allows you to FTP to a server the KML files that it is generating.

I am looking at using it to put tracking info on my own server.

This looks cool but am I seeing a 40 min time limit?

Yes....I was involved with several flights that KE4ROC did from the middle of the Marshall Space Flight Center here in Huntsville, AL....it had onboard live camera ATV with a night vision camera to film the Leonids meteor storm in the late 90's as well as aerogel canisters to capture meteor dust. The launch and downlinked video was sent out via the Marshall website as streaming video (before that became popular)....and was also carried live on NASA TV.

Recently, I was at the NASA BHALF student BalloonSat competition at the NASA Glenn center in Cleveland...although we didn't launch from the facility it was sponsored by NASA.

Regarding Google Earth - a network link is difficult to setup, not sure
you'd need the additional software to do it. Spacenear.us/tracker currently
produces a kml file which can be opened in google earth and will update in
real time. Does add another dimension to following flights (excuse the pun).

7850. Release, launch, let go...

Yahoo group: GPSL (2009 — 2010)
Date: 2010-07-30 13:58:12 UTC
From: Pete Lilja
Topic: 7850 Message: 7850

When initiating a HAB flight do we launch, release, let go, un-tie, free, liberate,
reject, un-hinder, float, cast, discharge, hurl, propel, project, catapult or any other related verb?

I find myself using "launch" but am not completely comfortable with that phrase...

Pete,
I like launch as a parallel to launching a boat from shore. I launching a balloon to sail through the ocean of air.

James,
I think you ment to say a network link is NOT difficult to set up and I agree with you there. I just found that GooPs has some interesting concepts. I think it is an easy way to play with some of the options that are available in google earth.

I thought this might generate a little more discussion but it probably really isn't worth expending a lot of effort discussing something this mundane. However....

...I like Howard's image by comparing it to launching a boat. I hadn't thought of it that way as launch had meant to me a lift-off like a rocket. But a gentle push of a sailboat to be carried by wind is much more apt and appropriate to a HAB flight.

And Keith's "we quiesce" is a lot of fun to say I'm not sure it parallels my experience other than I do believe I stand quiet with my mouth agape while watching my balloon (and all my expensive payload 'stuff') float away uncontrolled by me!

Isn't English fun?

Howard,

Something else that may be interesting would be to try and launch a series of balloons that float at altitude. Create a chain where the farthest balloon relays back to the source through the chain of balloons.

As the balloons are eventually brought down they could relay their descent back the chain also.

The only problem is the cost of a series of balloon payloads and the high risk of loosing them.

Jerry,

You're correct. We all flew 1W 900 MHz spread spectrum radios. I agree that more data was exchanged via other methods than was transferred at altitude. However, BASE was only one of the balloons and not the lead ground station. You could get a better idea about the total volume of data transferred from Jeff Dailey at Taylor (jfdailey@...).

We did have a carefully cell phone coordinated launch, with all balloons being released simultaneously with very similar ascent rates. Of course, since we all just flew up to burst and no one floated we were limited in our contact time. On the April 2009 flight, our balloon did receive data packets from four other balloons over a period of 58 minutes.

I think you could view the effort as a proof in principle of the possibility of a large scale airborne mesh network.

Hi Jerry,

I thought about that very idea about 20 years ago....I am thinking of trying it out with 4 floater balloons this Winter and having each one hop relay through to the one behind it all the way back to ground control here....I plan to space them out such that if one goes away, then they still won't be too far apart to close the gap with the missing balloon....I'll probably start out with 50 miles spacing between balloons to start.

Ah yes, though floaters are non-trivial to achieve, out of approximately 10 very concerted attempts at a float we actually floated only 4 times.

7867. 5 Years from Now

Yahoo group: GPSL (2009 — 2010)
Date: 2010-08-01 02:13:32 UTC
From: L. Paul Verhage
Topic: 7867 Message: 7867

I've been asked to speak about the future of near space. First is up to 2015.

I want to say that what we do was started in 1987. At the time, education was not a big part of it, it was mostly hams trying out ham equipment at high altitude. Gradualllly educaion got involved and is now one of the biggest growth areas. Colleges and high schools use near space to motivate students and encourage them to work on technical degrees. Some colleges have used near space to teach the principles of spaceflight. If the cost of spaceflight continues to decrease, then we could see more use of near space at universities. Hams provide most of the lift services, but there are cases of non-ham radios being used. Commerical and ISM radios could equal the number of ham radios used in near space by 2015. Perhaps in five years, commerical entities will provide launch services for schools. They have the benefit of being able to launch on weekdays, when most hams are working.

Hams were the first to experiment with repeaters in near space. While it's not a big money maker yet, using balloon repeaters is used commerically along the gulf coast. It may never grow very large, but it could be useful in emergency situations like fighting fires in moutainous terrain where repeater coverage is poor. Could a commerical outfit find this a profitable enterprise?

Because winds are too variable and not repeatable, I don't believe balloon borne platforms will be very practical for mapping or resource detection. The fact that balloons climb in altitude also hinders this because of the changing scale size ad level of details. ZPB can address some of these issues, but are still limited because they can't fly repeatable path. Perhaps for one time coverage, balloons will work well.

I foresee balloons still being used for atmospheric profiles. Satellites will be get better sensors for measuring the atmosphere. However, that also means balloons will get better sensors, also. A satellite can cover a larger area, but sacrifices the small details that balloons can measure. As long as the gases are mixed uniformly, balloons can measure them anywhere.
I don't see industrial processes being carried out in near space. But what about Internet servers in near space? Perhaps lots of people would be willing to check in to the environmental conditions and images on a near space website. The equiment would be paid for by advertisers on the website. Bigelow Aerospace has launched momentos into space that people paid to have launched. They can see them floating around on the space station's website. JP Aerospace has photographed business cards in near space. Is carrying personal stuff into near space a profitable venture when you consider the expense of recovery?

Burial services? An ounce of creamains could be placed inside a balloon and then launched. A digital camera pointed up will show the balloon bursting in near space and spreading the ashes. Or the ashs could be carried up in a container that is dumped in near space. Again, having a video recorder to record the event would be important.

Anyhow, these are things I'm thinking about. If you have any ideas or resources, please let me know.

Paul:

That sounds like a great business venture. You could take the balloon to them, say good by to grandma and let it go. The family could release the balloon. You would have to charge extra for sea scattering as you won't get the gear back.

7869. 20 years from Now

Yahoo group: GPSL (2009 — 2010)
Date: 2010-08-01 02:56:41 UTC
From: L. Paul Verhage
Topic: 7869 Message: 7869

The second question I need to address is what things do I foresee happening in 20 years.

I will stick with lighter than air craft. I think bigger is better and more useful. Also, a tethered balloon is more useful than a free floater. I can foresee large platforms tethered with carbon nanotube cables. Since 20 miles or more in altitude is too great for power cables, they will need solar cells. The distance to the horizon will be 400 miles, so near space stations could be useful cell phone towers. Half a dozen fixed platforms could route radio traffic across the US. Cell phone towers on the ground would decide when to send a message to a neighboring tower or to a balloon platform. Since the platform doesn't move like a satellite, it should be easier to connect to one. The tower can use a dish antenna for gain and save power in the transmission of the signal. The near space platforms are 400 or so miles apart, which is simliar to the distance to LEO satellites. But LEO satellites are contantly on the move and need more powerful transmitters to communicate with omni antennas. GEO satellites are fixed, but need more power because of their distance (22,500 miles). A fixed near space platform has the best benefits of LEO and GEO satellites.

A fixed platform could observe solar cell arrays on the ground to let utility companies know when the power output of an array will drop from cloud cover (thanks Mark for the idea). If near space stations (NSS) can measure winds, then wind farms would find them useful.

Instruments and experiments needing long term exposure could be placed in standardized racks onboard the NSS. Robots can load, unload, and operate experiments. Tele-operating in near space is no more difficult than doing the same thing at the bottom of the Gulf of Mexico to plug a BP oil well.
For redunacy, several balloons need to be attached to the NSS. They need to be a tightly woven plastic so hydrogen leaks out very slowly. Occasionally, additional H2 will need to be brought to the NSS. How do we bring the H2 and experiments to the NSS? Use an elevator. A practical space elevator will use crawlers that creep up a nanocarbon belt. I think the same thing could be used for the NSS. Several cables tether the NSS to the ground in a tripod. A belt directly below the NSS is used by crawlers to bring supplies to the NSS. This makes a NSS a practical test of ideas for a space elevator (which may be a project for next century).

What if the NSS could be made larger? Could one be large enough and dependable enough to host a human crew? People are planning to spend some $200,000 to take a 15 minutes ride in space. Would people be willing to spend say $20,000 to spend a day in near space? You could watch sunrise and sunset, something the space riders of Spaceship 2 won't be doing. You could don a spacesuit and walk around the platform. Who wouldn't want

to wear a real spacesuit?

What about combining extreme sports and the NSS? A NSS should be a safe platform for skydivers. Ride to the platform, don a spacesuit, exit the station, grabe the rail, and drop off. It would take specialized training, but I think it would be the ultimate extreme sport. It's the ultimate BASE jump.

We build telescopes in airplanes and mountain tops to get above water vapor. Getting above 99% of the atmopshere may be good enough for many space telescope applications. I know UVC, gamma, and x-rays are blocked above the stratosphere, but there's more raw light reaching 100,000 feet than the ground. The images are also steadier. Perhaps amateur astromomy clubs could afford to place a telescope on a NSS.

So, those are some of my initial thoughts. I need to organize my thoughts and research them in depth. If you have any suggestions, I'd love to hear them.

Thanks

Hi Paul,

Heck, we ALL talk about near space - after all, we did that all Friday a couple of weeks ago! So is this part of your degree program or what?

Note that Space Data Corp has turned a decent profit from it's medium-term vented latex floaters carrying proprietary cell sites. Space Data started out considering station-keeping long-duration balloons, but soon discovered that balloon volume, weight and cost soars exponentially with weight, thus driving them towards small latex bags like we're used to flying. The fact that they keep the sky full of their balloons over the area of interest, an have them networked, pretty well deals with the random flight trajectory issue.

DoD is becoming quite interested in using near space and lower balloons for remote sensing, communications and tactical purposes; maybe we in ARHAB might have inspired 'em? Of course, NASA's Columbia SBF has been launching "Buicks with 4 scientists" into near space for decades - but those flights ain't cheap.

EOSS has flown several in situ atmospheric CO2 and CH4 profilers for NOAA, and some of the results have been quite revealing. And astronomers have become interested in flying sub-orbital telescopes - almost as good birds like Hubble, but a LOT cheaper to fly, and you can get 'em back to fly again another day. A good example was the microwave background survey experiment that flew under a ZPB from Sweden to Canada a few years ago.

You mentioned ZPB's as the way to achieve long-duration flights. However, the Space Data technique seems to work just dandy. With newer polymer films coming out, super-pressure balloons may be the next wave of floaters. SPBs don't "burn" ballast to stay afloat, and the envelopes can be made quite UV-resistant. NASA has been working with AeroStar to develop SPBs of the size they're accustomed to flying, but the stresses required to hold gas pressure with 2000 kg neck loads are formidable. So I foresee some ARHAB group taking the initiative to make and fly a small SPB by 2015. Hmmm ... just WHO will it be?

And for sure, we can expect to see more for-profit organizations such as Space Data trotting out new sub-orbital services, using commercial and/or Part 15 RF links.

Forecasting the future is risky business - it's always easier to forecast in retrospect :=).

Regarding the scattering of ashes, I believe the EPA has some issues with that. There are various pilots/aircraft that are setup to do such a thing. Several years ago I stumbled across a website (don't remember what I was actually looking for...) that was talking about it, but they kept referring to it as "theoretical" since in many circumstances it would be illegal to do so.

If you did sea-side scattering, you probably wouldn't have as many issues with polluting, but then you'd somehow have to get the video back to the family.

Nevertheless, if I wind up cremated, I expect someone on this forum to sneak at least part of me into near space... ;-)

Mike,

Any details on the CO2 sensors? The company I work for has some interest in balloon-borne CO2 sensor profiles.

Still hoping someday to combine hobby and work.....

Ha! 20 years ago, the GPS-based APRS beacons that we all fly today
were at best a balloonist's wet dream. In 1975, the PCs were limited
to the domain of a few geeks, and 20 years later, they were common home
appliances. Whoda guessed?

Going out 20 years is an exercise in stretching one's grasp to match
his reach, IMHO. GL with that!

Great Video Rick! Super nice job! Wonderful shots from the payload and on the ground!

Based on the EOSS flight, ARBONET should have been looking in Nebraska for our payload!

We were at 99,783 ft at about the same latitude of burst and a descent rate of 584 ft at the lower altitudes... That would put us up /north / northwest of McPherson. Darn APRS!

I did find two more log entries that put us in line headed north east just east of the Windom cemetery.

Can anyone plot the landing zone based on EOSS's decent data as applied to ARBONET with 1 3/4 lbs payload and 5' chute?

The simulations by myself and others put us in way too close to and south of 56 and that now appears to be way off.

Louise and I almost headed north this weekend to look some more, and based on EOSS's flight, I am glad we didn't! :)

How would you tether one in 100 MPh winds?

Just something that seems terribly hard to do when i know what o a tethered one does in only 25MPh winds.

NSV flew ashes inside the balloon, hence distributed ashes of my dad this way a couple of years ago. Deb and I expect the same when our time comes.

On Jul 31, 2010, at 10:06 PM, Zack Clobes wrote:

We thought of this probably 15 years ago, And even contacted ohhh say
50 Funeral services around us here about developing such a service,and
not one was interested.

I thought about it again a few years ago, and did some more searching on
it. as far as rules and regulations, and there really isn't any.

The only restrictions I found are two. One is similar to our catch all
Far rule about not making a hazard to thos below. Like if you were to
spread at a low altitude over a large group of people.

As far as the Feds go the only rule they had was that if you were to
spread over federal lands Like National parks etc. you need to get a
permit for it.

But also in doing this ressearch I did find one guy that is doing it
already commercially.

But at a HUGE cost.

He only sends a few ounces of ashes aloft, and charges several thousand
dollars for the service!

Plus he doen't have a clue as to how the balloons work, i love this quote,

So what happens to the balloon?

After its release, the balloon travels to an altitude of approximately
five miles. At that height the temperature is 40 degrees below zero. The
balloon simple crystalizes and fractures, scattering the ashes to the
four winds.

Here is his web page,
http://eternalascent.com/index.html

Take Care Everyone!

They have patented this process!!!

They claimm to only send ashes to 30,000 feet. measley.

Okay, what I am going to post is a process of dumping ashes overboard from 100,000 feet. It will be made public and cannot be patented.

Okay, it's the process. Cups holding the ashes are mounted to a servo. While the cup is in the upright position, it is covered by a lid. When tipped to a 90 degree angle, the lid comes off and the ashes spill out. The mechanism must be carried on 3000 gram balloon and video taped with a digital camera.

I will write a sidebar for Nuts and Volts and post it to my Twitter account and blog.

Anyhow, anyone is free to use it. I'll make up diagrams and post them shortly.

Paul

No he only patented the Filling unit. How to place the ashes in the balloon and fill it and transport it filled to the release site. so that if there should be a premature pop that the ashes dont go all over the place. they are contained in this patented trailer more or less.

He has it like when apollo examined the Moon rocks. a sealed trailer with the goofy arms to handle stuff so that the room remains sealed etc. Thats what he patented.

7880. HAB in the High School

Yahoo group: GPSL (2009 — 2010)
Date: 2010-08-01 16:35:45 UTC
From: Pete Lilja
Topic: 7880 Message: 7880

I've sorta been bit by the bug and am a now balloonatic. I've been bouncing around the idea of approaching a local school district with the prospect of getting HABing started there. One school is now starting an 'Academy' format with technology being one of the disciplines. I'm sure I can get an audience with the school as I know several people that work there. What I need is ideas for a presentation to sell the idea...

While it might be a big project and maybe more than I'd like to tackle what I'm thinking is:

Offering to assist interested kids with obtaining a Tech Ham ticket.
Kids building a payload box
Assemblng a camera payload (CHDK and associated scripting)
Radios, TNC, GPS both aloft and ground tracking
ARDFing (back-up)
Weather and atmoshperic study

Everything would, of course, be focused on and culminate with a HAB flight and recovery.

Has anyone done anything similar with high school kids? I envision this as a semester long project which, with a good core of interested students, be easily doable in that kind of time frame.

I'd also think it would be easy enough to get donations of lifting gas and maybe even money for radios, cameras and payload box supplies.

I'd appreciate any discussion here of ideas, similar experiences, successes, pitfalls, what I'm missing, etc.

Thanks!

Pete

From: Earl Foster
Topic: 7880 Message: 7881

Pete,
One problem I ran across here in Texas was liability insurance. I went to a number of universities and high schools in the DFW area and while the science teachers were really interested they were stopped by their legal departments. Some of the instructors are still trying to work something out but it has been almost 2 years.

In addition to (or instead of) donations, you could approach the Iowa Space Grant Consortium which might fund this sort of educational venture.

Hey guys I am entering the 8th grade this year, do you know of a way for me to get funding? You can check out my site at www.BrendenGeary.com The links I have seen so far are for high school and beyond. My dad has been funding most of my projects, with some donations from others.

I wish I could have been at GPSL this year, but my dad says we will be in Pueblo for next years GPSL.

I would also like to ask what is everyone using to to track temp, inside & outside the payload, also what are about barometric pressure. If you are recording pressure and temp are you storing that in the payload or sending it to a base station?

Thanks,
Brenden

Hey guys I am entering the 8th grade this year, do you know of a way for me to get funding? You can check out my site at www.BrendenGeary. com The links I have seen so far are for high school and beyond. My dad has been funding most of my projects, with some donations from others.

I wish I could have been at GPSL this year, but my dad says we will be in Pueblo for next years GPSL.

In addition to (or instead of) donations, you could approach the Iowa Space Grant Consortium which might fund this sort of educational venture.

On Sun, Aug 1, 2010 at 11:35, Pete Lilja <plilja@...> wrote:

I've sorta been bit by the bug and am a now balloonatic. I've been bouncing around the idea of approaching a local school district with the prospect of getting HABing started there. One school is now starting an 'Academy' format with technology being one of the disciplines. I'm sure I can get an audience with the school as I know several people that work there. What I need is ideas for a presentation to sell the idea...

While it might be a big project and maybe more than I'd like to tackle what I'm thinking is:

Offering to assist interested kids with obtaining a Tech Ham ticket.
Kids building a payload box
Assemblng a camera payload (CHDK and associated scripting)
Radios, TNC, GPS both aloft and ground tracking
ARDFing (back-up)
Weather and atmoshperic study

Everything would, of course, be focused on and culminate with a HAB flight and recovery.

Has anyone done anything similar with high school kids? I envision this as a semester long project which, with a good core of interested students, be easily doable in that kind of time frame.

I'd also think it would be easy enough to get donations of lifting gas and maybe even money for radios, cameras and payload box supplies.

I'd appreciate any discussion here of ideas, similar experiences, successes, pitfalls, what I'm missing, etc.

Thanks!

Pete

Hi Mark,

The NOAA profiler, aka "Aircore", has two parts:

1. The airborne portion is 100 m length of about 1/4" OD tubing, coiled up and sealed at one end with a valve at the other. The tube is filled with a standard 380 ppm concentration of CO2 and air. Just before launch, the valve is opened, so that the tube vents during ascent. Now, during descent, the tube refills with ambient air, forming the gaseous equivalent of a core sample. On landing the valve is closed, thus sealing off the core sample. Due to the internal dimensions of the tube, the CO2 concentration of the core sample retains its structure, since diffusion is relatively slow in that long, skinny enclosure.

2. After the flight, the tube is connected to a very sensitive IR spectrometer, and the core sample is then pushed out from the end opposite from the flight valve using 380 ppm air. The spectrometer is tuned to absorption line(s) of the gas species of interest. The 380 ppm "push" gas serves as an "eof" marker.

If the aircore sample get to the lab within 24 hours, the CO2 concentration can be resolved with a resolution of 10 m in altitude with a precision of better than 1 ppm. As one can understand, high confidence in a timely recovery after landing is a key requirement.

Now, I've heard that there are some folks working on real-time in situ CO2 analyzers, and EOSS might be flying some of those by 'n by.

Very interesting, thanks Mike. I can buy a concentration precision (maybe even accuracy) of 1 ppm with their method, but I think 10m vertical precision is asking a lot from the sampling method. They can generate that precision, but I'd have my doubts on the accuracy.

Anyway, now I can Google for more ("NOAA aircore profiler") and I see a few hits worth investigating already. Seems a simple enough process and may be worth showing to some atmospheric science types at Creighton or NU.

I rather doubt that tethered near space balloons will emerge until
after teleportation displaces air travel. Until then, they'd serve
more as the barrage balloons deployed for air defense in WW I & II.

Hi Pete,

EOSS used to do a lot of local middle and high school flights. One of
the coolest projects was an ozone sampler created by some 5th grade kids
in Pueblo CO. They used a PE refrigerator jar with a hinged, spring-loaded
lid enclosing piece of ozone-sensitive colorimetric paper and a party balloon
partially inflated such that it would open the lid above about 50K' and let
it close on decent.

It worked! After recovery, the kids read the ozone paper, and it matched
the NWS satellite data taken that day!

We've also showed kids how to plot DF bearings on a map and use 'em to
track the balloon in flight. Nice project for a small team of kids.

More recently, we flew a peanut butter jar filled with dry lima beans for
an elementary school. After recovery, they planted the beans alongside
another set that stayed on the deck to see what exposure to the near-space
environment might have.

Another popular flight lets the kids do 3rd party QSOs thru the crossband
repeater.

And of course, all that exposure to ham radio can't help but intrigue a
few kids to get their ham tickets.

Good point, Mark,

Colorado Space Grant has kept EOSS flying for over 10 years. You might also look into possible outreach programs. Colo SGC got U. Colo involved in the "Upward Bound" program for disadvantaged Native American HS students. One of the program track includes building and flying balloonsats. We carried up 13 of 'em earlier this year, plus our two tracking beacons - quite an impressive flight string!

Hi Brendan,

Have you talked with the science teachers at your school? They may have
some budget for a small balloon flight so long as you share it with others.

'eternal ascent'

Hey, I thought *I* thought up the idea of balloon cremains scattering.
But my thought was to use a fast ascending 'blimpie' balloon:

http://global-western.com/Non-Standard_Ascent_Rate_Balloons.html

and dump the cremains by timer when the balloon gets to float, allowing the surviving relatives to see the release. This is of course tricky with winds aloft, sun angle, trajectory, haze, cloud cover, etc. I wonder how much business the 'eternal ascent' people do and if it in any way pays for the cost of the patent.

best regards,

- Mark ng0x

I haven't read the patent, but if it indeed does only cover the process of putting ashes into a latex balloon, then it is pretty darn easy to sidestep that technology by using a conventional payload/carry bin.

best

Yep, I'd say load the ashes into a cup connected to a servo. At altitude, dump the ashes overboard. We can get them up higher than 30,000 feet, besides.

A claim that restrictive may have been imposed by the USPTO examiner to get around some prior art - which could already be public domain. That would show pretty fast with a read of the patent disclosure. uspto.gov works pretty well.

Got a patent number?

That's the kind of cloud that I used to LOVE to fly around back in my
Waldo Pepper flying days with the Navy in the W. Pacific. Almost as
fun as 350 kt thru a canyon, but a LOT more forgiving if you brush a
wingtip :=).

Just put the parachute under the cup. Parachute slows ascent for a more "dignified final trip", balloon pops, parachute flips the cup, lid comes off and grandpa is spread over 3 states.

As an added bonus the same platform can be used to seed clouds:)

As a business I don't think you are going to get enough customers to make this viable. You would have to pay for an office and probably a motorcade to the launch site, along with music, chairs, etc to make it dignified.

Yep, I'd say load the ashes into a cup connected to a servo. At altitude, dump the ashes overboard. We can get them up higher than 30,000 feet, besides.

You'd have to charge a bunch to make it work. Filling a balloon and letting it pop by itself would be cheaper. But I'm thinking you could return a video of the dumping in near space and charge more. Seeing space and the earth's horizon would be the killer app here.

Please note, I'm not trying to start a business doing this. I just need to come up with ideas for growth in the near space arena. I thought this was a neat idea that I had come up with until a bunch of other people told me they thought of the same thing (and that there is a business already doing something similar).

From: Mike Manes
Topic: 7893 Message: 7902

Thanks, Joe.

Independent Claim 1 pretty well describes what some have proposed:

--- clip ---
1. A method for the dispersal of cremated remains comprising the steps of:

depositing a quantity of cremated remains into a balloon having dimensions preselected to contain sufficient quantity of gas to lift said quantity of remains to an altitude at which said balloon will burst from decreased exterior air pressure;

filling said balloon with at least said quantity of gas;

sealing said remains within said balloon;

transporting said balloon to a preselected launch site; and

releasing said balloon.
--- clip ---

Remaining Claims 2 & 3 are dependent. So if one wanted to work around this patent before it goes public in 3 years, just don't put the cremains >inside< the balloon envelope. Sort of what K-Mark said.

Full disclosure: I'm NOT a patent attorney - just got a few under my belt.

Me? I'm hoping to push up daisies at Ft Logan Nat'l Cemetery here in Denver.

So he is patening the filling system more than anything. The problem he is solving if you put grandpa in the balloon and it bursts during fill how do you recover grandpa? Blasting him all over the loved ones at the launch site would be a nightmare. SInce it is a fully enclosed system the size of the balloon is limited so that is probably why the low altitude.

A separate container should be cleaner and safer.

The other issue is the percieved littering of a balloon and container.
Bio-degradable parachute and string?

This is why I think you should use a cup that's dumper over the side with a servo. The arm the cup is mounted to swings far enough over the side that your dear departed pet rabbit doesn't get dumped on equipment. The lack of air will ensure the ashes drop away like a rock, rather than billow over the edge.

Or how about saving the cremation service and just dumping the body overboard like a burial at sea? Nawwwwww.

Or what about a compressed air cannon. Muffy could be loaded into the barrel like a shot gun shell. In near space a compressed air cylinder would fire the ashes up and away.

See my earlier. The patent covers inserting the cremains in the balloon envelope and letting it burst. No mention of a parachute or recovery, but the disclosure discusses use of a latex balloon due to its biodegrability.

After reaching a respectable height, the ashes are dumped along with seeds of flowers, eventually transforming the countryside into a flowering oasis. The payload then free falls to the ground impaling itself, an arrow pointed up to the heavens that says, "This sign attests to the fact that the ashes of [your favorite deceased here] were spread in the winds above, and may have needed a little help in the right direction!" :)

From: Mike Manes
Topic: 7893 Message: 7909

Yeah - imagine that impaling the rag top on your boss's Porche.

One thing to bear in mind, guys, is 14 CFR 101.7(b):

" No person operating any moored balloon, kite, unmanned rocket, or unmanned free balloon may allow an object to be dropped therefrom, if such action creates a hazard to other persons or their property."

Note that no one is exempt from the Dreaded 101.7 Catch 22 Rule.

Guess it all depends on whether one considers getting doused in cremains is hazardous - sheesh!

Date: 2010-08-02 22:29:11 UTC
From: Joe
Topic: 7893 Message: 7910
Attachments: 1 described; binary payloads are missing from this source WARC

I really would love to know how much it disperses (sp?) from 100K?

Thats where we thought,,, but never did the flight,, but was to xerox
copy up say a whole ream of paper into tiny like ticket tape parade
sized pieces with our contact information on them, and drop the
thousand from 100K just to see how far away some may have fluttered.

Be a fun and cheap experiment for some students!

Joe

We won't even talk about the particulate emissions that EPA might be
interested in...oh wait, that's the power plant employee in me talking.

;-)

Fugitive emissions.

Rog KC0MWM

7913. Re: [GPSL] HAB in the High School

Yahoo group: GPSL (2009 — 2010)
Date: 2010-08-03 00:29:21 UTC
From: ccccrnr@aim.com
Topic: 7880 Message: 7913

see if your school has any contacts to the Junior Academy of Science
http://www.amjas.org/

you'll also need to write up a really cool proposal

10years ago when I was in High School. The max they would give a student was a $300 grant
They also wanted to see lots of testing to demonstrate the Scientific Process.

Needless to say I didn't fly any balloons back then, as $300 doesn't cover enough flights to have "Statistical Relevance in the Scientific Process"
but if you can get a group project together things maybe different now.

Sincerely,
Carlton Corbitt

Hey guys I am entering the 8th grade this year, do you know of a way for me to get funding? You can check out my site at www.BrendenGeary.com The links I have seen so far are for high school and beyond. My dad has been funding most of my projects, with some donations from others.

I wish I could have been at GPSL this year, but my dad says we will be in Pueblo for next years GPSL.

In addition to (or instead of) donations, you could approach the Iowa Space Grant Consortium which might fund this sort of educational venture.

On Sun, Aug 1, 2010 at 11:35, Pete Lilja <plilja@...> wrote:

I've sorta been bit by the bug and am a now balloonatic. I've been bouncing around the idea of approaching a local school district with the prospect of getting HABing started there. One school is now starting an 'Academy' format with technology being one of the disciplines. I'm sure I can get an audience with the school as I know several people that work there. What I need is ideas for a presentation to sell the idea...

While it might be a big project and maybe more than I'd like to tackle what I'm thinking is:

Offering to assist interested kids with obtaining a Tech Ham ticket.
Kids building a payload box
Assemblng a camera payload (CHDK and associated scripting)
Radios, TNC, GPS both aloft and ground tracking
ARDFing (back-up)
Weather and atmoshperic study

Everything would, of course, be focused on and culminate with a HAB flight and recovery.

Has anyone done anything similar with high school kids? I envision this as a semester long project which, with a good core of interested students, be easily doable in that kind of time frame.

I'd also think it would be easy enough to get donations of lifting gas and maybe even money for radios, cameras and payload box supplies.

I'd appreciate any discussion here of ideas, similar experiences, successes, pitfalls, what I'm missing, etc.

Thanks!

Pete

7915. APRS abuse

Yahoo group: GPSL (2009 — 2010)
Date: 2010-08-02 17:12:46 UTC
From: Al Wolfe
Topic: 7915 Message: 7915

I'm a veteran of several balloon chases dating back to the Wintrax days in Indiana. I have seen a phenomenal growth in the use of GPS and APRS in tracking balloons. I have also seen remarkable growth in the abuse of the APRS system in tracking balloons and don't know whether it is ignorance or egocentricalism.

There have been several balloons lately aloft here in the Midwest with a path of Wide1-1, Wide2-x. While the 1-1 may certainly be useful near the ground, it has no place while at any altitude. This is a very selfish path! It can cause every properly configured APRS station in an area of over 100,000 square mile to repeat the balloon packets. While no path at all would likely be fine, a path of Wide2-1 would probably not be considered abusive. This would only fire off the digis.

As I said a path with 1-x can certainly be useful near the ground when trying to find a downed package. The Tiny Trak can change paths with a simple contact closure. A simple anaroid or pressure switch would be all that's needed to change to a less abusive path at some fairly low altitude. Or some simple telecommand system could be used.

The APRS system has only a limited capacity and is shared by all the users. Ten or twelve years ago it would take weeks to accumulate 300 different stations in the log here. Now it often takes only a couple of hours to see that many. In many areas the digis are in nearly constant use. Eliminating the Wide1-1 balloon packets would certainly cut out some of the clamor.

Some have argued that balloons should use another frequency than 144.39. However, the infrastucture exists on 39 so it makes sense to use it. Just don't abuse it.

73,
Al, K9SI

Brenden:

Nobody that I've seen on this list gets mad at someone willing to learn - frequent beaconing with questionable path settings is a fairly common mistake, so don't sweat it (but do take the advice to heart). The motivation to find your equipment after you launch is a strong one, and the resulting beacon interval and path choices are understandable. Every once in a while an email like this is a good "heads up" to everyone on the list that we're using a resource (the APRS network) that exists as a result of each individual's love of the hobby.

Welcome to the club, don't give up, and good luck finding your most recent flight!

That's really cool, Mark. Thanks for posting the link.

I'm looking forward to seeing the outcome of both of these flights and it's
nice to know people on this list had a part.

Part of that might be me. I'll check my TT3 program when I get home.

So Wide2-1 on ascent and Wide1-? for descent?

7923. Re: [GPSL] APRS abuse

Yahoo group: GPSL (2009 — 2010)
Date: 2010-08-03 14:56:52 UTC
From: Michael Willett
Topic: 7915 Message: 7923

This APRS topic as it relates to ARHABing is not widely publicized, but I have learned the following over the past year:

Wide2-1 or [EMPTY PATH FIELD] is for altitudes that are over a few thousand feet AGL (Above Ground Level), where the radio horizon can now hit several digi's.

EMPTY PATH FIELD means leave the path field blank in the config program.

Wide1-1, WIDE2-1 would be for under a few thousand feet where the radio horizon is a small foot print and the APRS needs help getting to a repeater or digi.

In sparse, very low population areas, where few digi's or repeaters exist, I might get more aggressive with the setting to let a bit of chaos out for the last few thousand feet with WIDE2-2.

If you are flying an Open Tracker or Tiny Track of late, some have the ability to do bank switching. You program the tracker to bank switch based on altitude.

If altitude < 2000 ft AGL, use bank 1, which is the same as bank 2 with the exception that the path is WIDE1-1, WIDE2-1 in that order.

If altitude is >2000 ft AGL, use bank 2, where the Path is [EMPTY PATH FIELD] for a metro-like area, or WIDE2-1 for a less dense area and never more than these two in most any other area.

The altitude to switch is debatable, but as a rule up to a few thousand AGL (Above Ground Level) should get the job done with WIDE1-1, and no path or WIDE2-1 will get the job done up higher.

So if you are in Denver, the altitude is about 5280 ft already, you would switch banks at say 6500 ft, because the radio horizon to the east, north and south increase rapidly on their own. Here in the Dallas area we are at around 650 ft ASL, so we would switch at 650 + 2000 or 2650 ft, I set mine for around 3000 just to make the APRS police perspire a bit, then go to no path or WIDE2-1 only. :)

The flight computer I'm about to market allows you to switch banks and uses
a PICAXE to do it. So it will allow the smart pathing, but I need
recommendations to put into the directions.

Thanks,
Paul

From: natewac@aol.com
Topic: 7925 Message: 7925

If nothing changes a balloon launch will take place Saturday, August 7 from Rantoul, Illinois . I'm looking to schedule a/some contacts from a couple of big gun Missouri stations to work the cross band repeater. Doing so may make some good standings in the ARHAB records (http://www.arhab.org/ARHABrecords.htm). Please email me at natewac@....

Dear friends,
I'm attaching a simple .jpg that shows the approximate radio horizon for the BASE 49 flight on Saturday. This horizon is assuming a float altitude of 72 kft. At the moment, floating at that altitude could allow the system to land in west central Indiana. I may opt to do a non-floating flight with a slow climb and a much higher burst that could extend the radio horizon without dramatically shortening the time above 72 kft.
I'll attempt to share the final flight plan as early as I can, but it may not be known until late on Friday.
Thanks for the support,Howard

Hi Brendan,

EOSS has recovered 155 of its 155 payload stings to date over the past
20 years. During the first 5 years or so, GPS was beyond our reach, so
we relied strictly on 2m DF triangulation. The key here is to have
a tracking and recovery team deployed around the predicted landing site
when the balloon launches.

Since then, we were one of the first groups to fly a GPS-based APRS beacon.
On that first flight, we ran on 144.39, and ended up crashing the KPC-3 due
to the excessive amount of traffic that it heard at altitude. So we've moved
back down to 144.34 and arrange for some home-based I-gates to get us into
the "infrastructure" on every flight. It's no big deal. In fact, on most
flights, one of our trackers has to do no more than tune his home xcvr down
50 kHz before he leaves home.

Our APRS beacons have never run over 350 mW xmit power, and although we beacon
GGA every 30 sec for our own flights, we can back off to 60 sec for shared
freqs like at GPSL. This power level yields solid data out past 100 miles
downrange at altitude (Line of sight is a magic thing), and further confers
the benefit of extended operational life from a smaller, lighter battery.

Although I can understand wanting to know your peak altitude as precisely
as possible, consider this: at 1000 fpm, you're ascending 166.7 ft or 50m
every 10 sec. That's less than the VDOP of your GPS reading - sort of like
measuring with a micrometer and marking with chalk. Further, the only reason
I can think of to record peak altitude that precisely would be if you were
attempting to beat the current ARHAB record of over 128 K'. And if you're
hauling up enough batteries to support a 10W xmtr beaconing every 10 sec,
fugeddaboudit!

Further, one can get a pretty good estimate of one's actual peak altitude
by by finding the intersection of the ascent and descent regression lines
taken from the data just before and after burst. It's not guesswork - just
math.

I am only adding this as it seems to be a topic of great interest to the group. Feel free to ask questions, but I admit it doesn't do much to bring the discussion closer to reality. However, this did happen, pretty much.http://browerpropulsionlab.com/directory/BPL_001_Funeral_Mission_for_Conrad_Carpenter

Or just log the gps on your flight computer. You'll have at least 1hz altitude data that way, which is surely good enough- and certainly well beyond vdop as mike says.

That's what we've done in the past. We then transmit the detected peak
periodically via a telemetry string for the entire descent.

From: ccccrnr@aim.com
Topic: 7915 Message: 7933

I have to respectfully disagree with most every thing said here.

Here in Missouri there is little digi or i-gate network. and around St Louis even with 1watt you very well might not get onto the internet driving around.

and most of the traffic is just weather beacons or digis balasting with 50 to 100Watts on 2 meter so most of the traffic doesn't care about congestion or missing a packet.

Also even in an area with a great Network like Kansas where GPSL was this year, not everything gets in.
Not a signal packet after we got on the ground made it into the network from a Fixed digi-igates, and we landed only a couple miles outside of McPhearson. So normally nothing would have been heard once we were on the ground, if it hadn't have been GPSL

Also the more hardware you fly you increase cost, weight, and batteries, you also decrease max altitude. Not to mention airtraffic filing concerns, and impact load should you hit a house or car on the ground.
There is also a responsibility to make sure you recover your gear and not litter on other unsuspecting land owners.

So levering the largely unused network out-there can make more sense that saying throw another couple hundred dollars in the payload for logging and forget it.

Sincerely,
Carlton Corbitt
-.- .. ....- -. .... -.-

Hi Brendan,

EOSS has recovered 155 of its 155 payload stings to date over the past
20 years. During the first 5 years or so, GPS was beyond our reach, so
we relied strictly on 2m DF triangulation. The key here is to have
a tracking and recovery team deployed around the predicted landing site
when the balloon launches.

Since then, we were one of the first groups to fly a GPS-based APRS beacon.
On that first flight, we ran on 144.39, and ended up crashing the KPC-3 due
to the excessive amount of traffic that it heard at altitude. So we've moved
back down to 144.34 and arrange for some home-based I-gates to get us into
the "infrastructure" on every flight. It's no big deal. In fact, on most
flights, one of our trackers has to do no more than tune his home xcvr down
50 kHz before he leaves home.

Our APRS beacons have never run over 350 mW xmit power, and although we beacon
GGA every 30 sec for our own flights, we can back off to 60 sec for shared
freqs like at GPSL. This power level yields solid data out past 100 miles
downrange at altitude (Line of sight is a magic thing), and further confers
the benefit of extended operational life from a smaller, lighter battery.

Although I can understand wanting to know your peak altitude as precisely
as possible, consider this: at 1000 fpm, you're ascending 166.7 ft or 50m
every 10 sec. That's less than the VDOP of your GPS reading - sort of like
measuring with a micrometer and marking with chalk. Further, the only reason
I can think of to record peak altitude that precisely would be if you were
attempting to beat the current ARHAB record of over 128 K'. And if you're
hauling up enough batteries to support a 10W xmtr beaconing every 10 sec,
fugeddaboudit!

Further, one can get a pretty good estimate of one's actual peak altitude
by by finding the intersection of the ascent and descent regression lines
taken from the data just before and after burst. It's not guesswork - just
math.

I have to respectfully disagree with most every thing said here.

Here in Missouri there is little digi or i-gate network. and around St Louis even with 1watt you very well might not get onto the internet driving around.

and most of the traffic is just weather beacons or digis balasting with 50 to 100Watts on 2 meter so most of the traffic doesn't care about congestion or missing a packet.

Also even in an area with a great Network like Kansas where GPSL was this year, not everything gets in.
Not a signal packet after we got on the ground made it into the network from a Fixed digi-igates, and we landed only a couple miles outside of McPhearson. So normally nothing would have been heard once we were on the ground, if it hadn't have been GPSL

Also the more hardware you fly you increase cost, weight, and batteries, you also decrease max altitude. Not to mention airtraffic filing concerns, and impact load should you hit a house or car on the ground.
There is also a responsibility to make sure you recover your gear and not litter on other unsuspecting land owners.

So levering the largely unused network out-there can make more sense that saying throw another couple hundred dollars in the payload for logging and forget it.

Sincerely,
Carlton Corbitt

Hi Brendan,

EOSS has recovered 155 of its 155 payload stings to date over the past
20 years. During the first 5 years or so, GPS was beyond our reach, so
we relied strictly on 2m DF triangulation. The key here is to have
a tracking and recovery team deployed around the predicted landing site
when the balloon launches.

Since then, we were one of the first groups to fly a GPS-based APRS beacon.
On that first flight, we ran on 144.39, and ended up crashing the KPC-3 due
to the excessive amount of traffic that it heard at altitude. So we've moved
back down to 144.34 and arrange for some home-based I-gates to get us into
the "infrastructure" on every flight. It's no big deal. In fact, on most
flights, one of our trackers has to do no more than tune his home xcvr down
50 kHz before he leaves home.

Our APRS beacons have never run over 350 mW xmit power, and although we beacon
GGA every 30 sec for our own flights, we can back off to 60 sec for shared
freqs like at GPSL. This power level yields solid data out past 100 miles
downrange at altitude (Line of sight is a magic thing), and further confers
the benefit of extended operational life from a smaller, lighter battery.

Although I can understand wanting to know your peak altitude as precisely
as possible, consider this: at 1000 fpm, you're ascending 166.7 ft or 50m
every 10 sec. That's less than the VDOP of your GPS reading - sort of like
measuring with a micrometer and marking with chalk. Further, the only reason
I can think of to record peak altitude that precisely would be if you were
attempting to beat the current ARHAB record of over 128 K'. And if you're
hauling up enough batteries to support a 10W xmtr beaconing every 10 sec,
fugeddaboudit!

Further, one can get a pretty good estimate of one's actual peak altitude
by by finding the intersection of the ascent and descent regression lines
taken from the data just before and after burst. It's not guesswork - just
math.

Which hobby seems to be dying off? HAM or ARHAB... or both? I got my ham ticket so I can fly balloons. Yes I have had my issues and have lost a bunch of money in my last payload. Thanks to family and friends, some on this list, I will fly again on Sept 4. I plan on taking down the High School science fair, if they will let me in. I'm only entering the 8th grade but when I do take down the Science fair with my data and photos I expect to see more balloons next year. I started when I saw the two or three MIT students fly, so no I do not think it is dying I think it is just starting to take off.

I live in Southern California and trust me I can see the congestion on the APRS network. I thought I was being smart by trying to use a freq other than 144.39 like 154.39 and use my D700 to track it myself. I was told that I shouldn't do this because even if this freq is open in my area, it may not be when I get to altitude when my signal will go for 100's of miles. I this bogus info?

What are your thoughts

Absolutely not bogus. one tenth of one watt at 100,000 feet can be heard
easily for hundreds of miles. Often over 400 miles.

So thats a 800 mile diameter circle!

7937. BalloonSats and Education

Yahoo group: GPSL (2009 — 2010)

I guess this is more for Bill Brown and EOSS.

From the early days, education was a part of what we do. Would it be fair to say education really took off when the advent of BalloonSats? It appears there are far more near space launches today because universities are getting involved. Does that sound correct?

The first I heard of BalloonSats was 2003. They didn't start much earlier than that, did they?

Were the ashes released?

Paul

Yes, but as it was a fictitious astronaut, I used fictitious ashes, and as he was a Carpenter, the ashes were sawdust. I figured that would save me from the 'medical waste disposal' issues. As it turned out the flight was to an extremely low altitude as I had left the permissions to local agents who didn't manage that process well. Turns out the site was directly under military air space. I have a great letter from the authorities describing the reasons for declining permission. The good news was that since the balloon was tethered, the audience could see the deployment and be present en masse for the recovery. The capsule was an altoids tin with a release that was activated by the dropping of the Flight Termination Unit. With this separate capsule, I could have an open casket funeral and people could see the 'sarcophagus' that was going to be flown.

I am only adding this as it seems to be a topic of great interest to the group. Feel free to ask questions, but I admit it doesn't do much to bring the discussion closer to reality. However, this did happen, pretty
much.http://browerpropulsionlab.com/directory/BPL_001_Funeral_Mission_for_Conrad_Carpenter

Balloon Sats, what is your definition of a BalloonSat?

As far as launches go, Near Space Sciences is a year behind Bill ELK.
out first launch, was August of 1988.

Hi Brendan,

I don't think that either ham radio or ARHAB is dying off. Many new hams get their tickets in order to enjoy perhaps a small sliver of the ham radio hobby, such as ARES or ARHAB, and later discover more and more of the vast array of activities offered by the hobby, such as DXing, microwaves, ARDF, etc. I'm sure that if you were to join up with a ham club in your area, you'd have a chance to see what I mean.

EOSS actually sprung forth from a ham club called Western Vision Network, a Denver-area group of hams who specialized in ATV (amateur television). A few of them, inspired by Bill Brown's pioneering work, decided to fly an ATV transmitter and camera into the stratosphere. So EOSS-1 was actually WNV-1, but WVN died off years ago.

You're right about ARHAB not dying off - if anything, it's growing like Topsy! 20 years ago, there were just a handful of balloon groups in the US, and none overseas. Today, there at least that many coming into the fold every few months!

By the way, I may have hinted in an earlier response at one of EOSS's secrets to its recovery rate: have a tracking and recovery team already deployed when the balloon launches. Although ARHAB can be a "one man game", it's a lot more fun, and less costly, if you gather a team to work with you. Which points back to my earlier point about joining a ham club. I assure you that a young fellow such as yourself will be welcomed with open arms by some of those old timers who got their first tickets about your age - but back in the vacuum tube era.

I think you typoed "154.39" in your earlier email - you meant 145.39 didn't you?
